

## **About the Conference**

Intelligent mobility on road, in air, on sea or on rail is a trending topic which is covered by the ICMIM since 2015. Key enabling technologies including hardware components, circuits and systems up to terahertz range as well as signal processing techniques and interference issues are addressed by the conference. Potential applications include automation with radar and other sensing techniques, navigation and localization, mobile communications, driver assistance, and over-the-air testing.
