**Part 6-23: Mechanical test methods –
Mechanical misaligned folding test method**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) IEC draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). IEC takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, IEC had not received notice of (a) patent(s), which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at <https://patents.iec.ch>. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 62715-6-23 has been prepared by IEC technical committee 110: Electronic displays. It is an International Standard.

The text of this International Standard is based on the following documents:

Draft	Report on voting
110/1702/FDIS	110/1717/RVD

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/publications.

A list of all parts in the IEC 62715 series, published under the general title *Flexible display devices*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn, or
- revised.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

The market for foldable panels has been growing steadily. The first foldable product which has foldable panel was launched in 2019 as a smartphone. Since then, many other manufacturers have released a variety of foldable smartphones. In the future, it is expected that various types of foldable products such as smartphones, tablets or laptop computers, etc. will be released continuously.

These foldable products would be folded and unfolded repeatedly by users. This means that as the period of use increases, the number of times for folding and unfolding the foldable product increases. For this reason, the mechanical robustness of the foldable panel is expected to vary depending on the duration of use and the user style (e.g. heavy users). [1]¹ This document will introduce the mechanical durability test to reflect the actual usage environment. This test method can also be an important evaluation item as much as the mechanical durability test for the initial foldable panel state.

The example of an actual usage environment can be demonstrated in the below situation. As mentioned earlier, when the usage time increases, the number of folding and unfolding of the foldable product also increases. Taking smartphones as an example, users unfold the foldable product in order to use it, then fold it again to easily hold or carry it. Users repeat this action several times in a day: they unfold and fold foldable products repeatedly to receive calls, to send text messages or to search the Internet. Users often drop foldable products or bump their foldable products somewhere because they hold their smartphone almost every day.

If the users repeatedly fold and unfold the device, or if the device is subjected to shocks (such as dropping or pressing in local area), it can cause the misaligned state of the foldable product. In this document, the situation that can cause misalignment of the foldable product is limited to the state of being shocked by dropping or being pressed after repeated folding and unfolding. The test simulates all of these processes and is defined as the mechanical misaligned folding test. Therefore, this mechanical misaligned folding test consists of a cyclic folding test and a drop test.

This document introduces the measurement conditions and measurement methods of the mechanical misaligned folding test method, which is an objective mechanical durability test method that takes into consideration the actual usage environment of the foldable panel.

¹ Numbers in square brackets refer to the Bibliography.

FLEXIBLE DISPLAY DEVICES –

Part 6-23: Mechanical test methods – Mechanical misaligned folding test method

1 Scope

This part of IEC 62715 specifies the standard measuring methods to evaluate the mechanical durability of foldable display modules, especially mechanical durability under the condition reflecting the actual usage environment.

2 Normative references
