## CONTENTS

FOREWORD.....	3
INTRODUCTION.....	5
1 Scope.....	6
2 Normative references .....	6
3 Terms, definitions and abbreviated terms .....	6
3.1 Terms and definitions related to standards.....	7
3.2 Terms and definitions related to the environment.....	7
3.3 Terms and definitions related to credibility and metrology .....	8
3.4 Other terms and definitions .....	10
3.5 Abbreviated terms.....	10
4 Principles for ensuring credible environmentally relevant performance assessments .....	10
4.1 General.....	10
4.2 Representativeness .....	11
4.3 Measurement repeatability .....	11
4.4 Measurement reproducibility .....	12
4.5 Measurement accuracy .....	12
4.6 Cost of testing .....	12
4.7 Anti-circumvention .....	12
4.8 Review of standards .....	13
5 Requirements for ensuring credible environmentally relevant performance assessment methods .....	13
5.1 General.....	13
5.2 Identifying environmentally relevant assessment methods .....	13
5.3 Drafting credible environmentally relevant performance assessment methods.....	15
5.3.1 Overview .....	15
5.3.2 Representativeness .....	16
5.3.3 Measurement and costs.....	17
5.3.4 Minimizing the risk of circumvention .....	17
5.4 Review of standards .....	18
6 Guidance for ensuring credible environmentally relevant performance assessment methods .....	18
6.1 General considerations when applying the principles of credibility.....	18
6.2 Guidance on assessing the representativeness of environmentally relevant performance assessment methods .....	18
6.3 Guidance to reduce the risk of circumvention of environmentally relevant performance assessment methods .....	20
Annex A (informative) Practical examples .....	22

Figure 1 – Identification of an environmentally relevant assessment method or parts thereof.....	14
Figure 2 – Systematic approach for drafting standards with credible environmentally relevant performance assessment methods .....	16
Table A.1 – Examples of non-representativeness and circumvention .....	22

## INTERNATIONAL ELECTROTECHNICAL COMMISSION

## SECURING CREDIBLE ENVIRONMENTALLY RELEVANT PERFORMANCE ASSESSMENT METHODS IN STANDARDS

### FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) IEC draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). IEC takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, IEC had not received notice of (a) patent(s), which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at <https://patents.iec.ch>. IEC shall not be held responsible for identifying any or all such patent rights.

IEC Guide 121 has been prepared by the Advisory Committee on Environmental Aspects (ACEA).

The text of this IEC Guide is based on the following documents:

Draft	Report on voting
SMBNC/43/DV	SMBNC/52/RV

Full information on the voting for the approval of this Guide can be found in the report on voting indicated in the above table.

The language used for the development of this Guide is English.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at [www.iec.ch/members\\_experts/refdocs](http://www.iec.ch/members_experts/refdocs). The main document types developed by IEC are described in greater detail at [www.iec.ch/standardsdev/publications](http://www.iec.ch/standardsdev/publications).

## INTRODUCTION

The IEC has been developing and publishing standards to support industry and other stakeholders for over 100 years, and the last few decades have seen an increase in the importance of standards that address environmental matters. The protection of people from the potential safety hazards of products has always been an important aspect in the portfolio of standards developed by the IEC, and today society at large is also demanding that products do not damage the world in which we live.

Therefore, there is a growing demand for publications that include assessment methods to determine whether a product can cause harm to the Earth's ecosystem. For instance, the quantification of hazardous emissions to the environment (for example, fluorinated or other greenhouse gases) helps to counteract climate change.

The possible harm to the Earth's environment can be caused either directly by a product, for example, through the emission of harmful substances such as greenhouse gases or other toxic pollutants directly to land, water, or air during manufacture, use, or end-of-life phase, or indirectly by the consumption of resources such as energy or water (called "inputs") by a product. These can affect the environment through, for example, emissions coming from the production of such inputs and the depletion of the Earth's resources.

IEC and other international standards are expected to provide commonly agreed, objective and unbiased assessment methods to determine, amongst other things, quantitative properties of a product or system, such as CO<sub>2</sub> emission or energy consumption. The measurement result can then be used to prepare an associated declaration to demonstrate the conformity of the product to specified requirements. Even if IEC standards do not include assessment methods to assess the direct impact of products on the environment, it is possible that they include methods relating to a means to assess (or consider) the indirect impact of that product on the environment, for example, energy consumed to deliver one or more product functions. In this Guide, assessment methods of either the direct or the indirect environmental impact of products are referred to as "environmentally relevant assessment".

Testing for environmental impacts, whether beneficial or detrimental, is not always easy. For instance, such impacts cannot always be readily measured in a consistent and uniform manner. This can lead to ambiguity and debate as to the usefulness of such a test.

When developing an assessment method, it is already general practice to consider classical aspects such as measurement repeatability, reproducibility, and accuracy, as well as the costs of testing. However, these considerations alone do not guarantee that such assessment method is credible (from the environmental performance point of view). For an IEC standard to be credible, it needs to ensure that its environmentally relevant performance assessments are representative of how the product is used, maintained, and disposed of in real-life and to prevent, as far as practicable, circumvention. Representativeness and (anti-)circumvention will be extensively addressed in this Guide.

This Guide is complementary to IEC Guide 109. While IEC Guide 109 describes the general principles of specifying environmental aspects in IEC publications, this Guide provides principles and requirements to ensure that standards writers are made aware of and consider the aspects of credibility described in this Guide.

In this Guide the term "committees" includes "technical committees, TCs", "project committees, PCs", "subcommittees, SCs" and "systems committees, SyCs".

Since environmentally relevant performance assessment methods are present in standards applicable to many committees, this Guide was prepared by ACEA and was circulated to all IEC technical committees, some advisory committees, IEC Conformity Assessment Board and CEN-CLC ECO-CG/TF2 for comments.

The following IEC committees are thanked for their active contribution to the preparation of this Guide: NL NC, KR NC, JP NC, TC 59, TC 100, and TC 111.

# SECURING CREDIBLE ENVIRONMENTALLY RELEVANT PERFORMANCE ASSESSMENT METHODS IN STANDARDS

## 1 Scope

This Guide specifies principles, requirements, and guidance for standards writers to identify whether an assessment method in their standard can be used to obtain an indication of the environmental performance of a product and to ensure that such assessment is credible.

This Guide applies to standards covering environmental performance of new products and as appropriate to standards covering environmental performance of second life products (for example, refurbished or remanufactured).

This Guide is therefore intended to ensure that assessment methods developed by standards writers are credible. The credibility of an environmentally relevant performance assessment method is determined by taking into account all the related principles, namely representativeness, measurement repeatability, measurement reproducibility, measurement accuracy, cost of testing, anti-circumvention, as well as review of standards.

Environmentally relevant performance assessment methods can be present in many IEC standards (for example, standards covering performance aspects of products), and not only those focused on the environment. This Guide will be applicable to those as well.

This Guide is not applicable to standards containing environmentally relevant performance assessment methods that are not assessed by test (for example, assessment by inspection or simulation), nor is it applicable to other aspects not linked to environment, such as electromagnetic compatibility (EMC) and electromagnetic fields (EMF).

This Guide does not include guidance on whether all environmentally relevant aspects are covered by an IEC standard. This Guide also does not give guidance on whether a performance assessment method was successfully identified as environmentally relevant.

NOTE The IEC Standardization Management Board (SMB) has decided that Guides such as this one can have mandatory requirements which shall be followed by all IEC committees developing technical work that falls within the scope of the Guide, as well as guidance which may or may not be followed. The mandatory requirements in this Guide are identified by the use of "shall". Statements that are only for guidance are identified by using the verb "should" (see IEC Directives Supplement Part 1, A1.1).

## 2 Normative references

There are no normative references in this Guide.
