Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and <https://patents.iec.ch>. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 37, *Biometrics*.

This third edition cancels and replaces the second edition (ISO/IEC 29794-1:2016), which has been technically revised.

The main changes are as follows:

- the definitions of “quality”, “quality score”, and “utility” have been aligned with those in ISO/IEC 2382-37:2022;
- methods for evaluating the efficacy of quality assessment algorithms have been added;
- ASN.1 encoding as defined in ISO/IEC 39794-1 is supported.

A list of all parts in the ISO/IEC 29794 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

Quality measures are useful for several applications in the field of biometrics. While ISO/IEC 19784-1 specifies a structure and gives guidelines for quality score categorization, this document defines and specifies methodologies for objective and quantitative quality score expression, interpretation and interchange.

This document establishes a framework that facilitates the use of biometric sample quality assessment and scoring tools. The tools are intended to encourage innovation and performance improvements in, and interoperability of, biometric systems generally. The ISO/IEC 29794 series presents several biometric sample quality assessment and scoring tools, the use of which is generally optional but can be determined as mandatory by particular application profiles or specific implementations. The ISO/IEC 29794 series is prepared to accommodate additional parts that address the biometric modes specified by the ISO/IEC 19794 series and the ISO/IEC 39794 series, with part numbers and titles aligning appropriately. However, as this document is intended for use by all biometric modes, a mode does not necessarily need a mode-specific part to make use of quality scores.

Several applications can benefit from the use of biometric sample quality measures. An example is the use of real-time quality feedback as part of the biometric capture process to improve the operational efficiency and performance of a biometric system. Other examples include data fusion for which multiple samples or references are available in the comparison process, either from a single or multiple biometric mode, and hardening systems against presentation attacks using or targeting low quality biometric samples. The association of quality measures with biometric samples is an important component of quality measure standardization. Quality fields as specified in [Clause 7](#) are included in biometric data interchange formats. If a CBEFF (Common Biometric Exchange Formats Framework) header is present, then CBEFF_BDB_quality may additionally be used to express quality measures. Useful analyses can be performed using quality measures along with other data to improve the performance of a biometric system. For example, correlating quality measures to other system metrics can be used to diagnose problems and highlight potential areas of performance improvement.

Information technology — Biometric sample quality —

Part 1: Framework

1 Scope

This document establishes the following items for any or all biometric sample types as necessary:

- terms and definitions that are useful in the specification and use of quality measures;
- purpose and interpretation of biometric quality scores;
- motivation for developing biometric sample datasets for the purpose of quality score normalization;
- format for exchange of quality assessment algorithm results;
- methods for aggregation of quality scores;
- methods for evaluating the efficiency of quality assessment algorithms.

The following are outside the scope of this document:

- specification of minimum requirements for sample, module, or system quality scores;
- standardization of quality assessment algorithms;
- assessment of utility of biometric samples or references for human examiners.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.
