## FOREWORD

1) ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.
2) The formal decisions or agreements of IEC and ISO on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC and ISO National bodies.
3) IEC and ISO documents have the form of recommendations for international use and are accepted by IEC and ISO National bodies in that sense. While all reasonable efforts are made to ensure that the technical content of IEC and ISO documents is accurate, IEC and ISO cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
4) In order to promote international uniformity, IEC and ISO National bodies undertake to apply IEC and ISO documents transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC and ISO document and the corresponding national or regional publication shall be clearly indicated in the latter.
5) IEC and ISO do not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC and ISO marks of conformity. IEC and ISO are not responsible for any services carried out by independent certification bodies.
6) All users should ensure that they have the latest edition of this document.
7) No liability shall attach to IEC and ISO or their directors, employees, servants or agents including individual experts and members of its technical committees and IEC and ISO National bodies for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this ISO/IEC document or any other IEC and ISO documents.
8) Attention is drawn to the Normative references cited in this document. Use of the referenced publications is indispensable for the correct application of this document.
9) IEC and ISO draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). IEC and ISO take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, IEC and ISO had not received notice of (a) patent(s), which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at https://patents.iec.ch and www.iso.org/patents. IEC and ISO shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 30184 has been prepared by subcommittee 41: Internet of Things and Digital Twin, of ISO/IEC joint technical committee 1: Information technology.

The text of this International Standard is based on the following documents:

| Draft | Report on voting |
|---|---|
| JTC1-SC41/453/FDIS | JTC1-SC41/469/RVD |

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this International Standard is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1, and the ISO/IEC Directives, JTC 1 Supplement available at www.iec.ch/members_experts/refdocs and www.iso.org/directives.

**IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.**

# INTRODUCTION

The IoT environment has become widespread, dynamic, and complex, and is constantly evolving. IoT objects and their associations to users, or to other objects, should be identified. Current identification approaches rely on proper device categorization based on pre-determined taxonomies. Once categorized, devices advertise themselves to the network. When new types of IoT objects emerge, the taxonomy is renewed and new IDs are assigned.

As a complement to existing solutions, this document simplifies the requirements imposed on devices through the adoption of an autonomous procedure. This method reduces the need for detailed classification, standardization, and certification of device types by eliminating the need for devices to self-identify and advertise.

This document focuses on the requirements and the framework for autonomous identification of IoT objects, especially in connected home environments. The objects in this document include IoT devices and applications. The IoT object identification is to identify the IoT object type and the associations among the IoT objects.

Inspecting data patterns produced by IoT objects allows for autonomous type and association identification. The data patterns may be inspected if the IoT object has given explicit consent. The data patterns to be inspected can be a selected feature from the raw data such as the port number and protocol number. An accumulated feature set over time can also be used – minimum or maximum packet size, average input rate, average inter-arrival times of packets, and so on – if the IoT object gives explicit consent to allow the collection and storage of such data.

By doing so, the need for detailed classification, standardization, and certification of object types is reduced; and devices are relieved from the burdens of identifying and advertising themselves. It will motivate and spread the development of new types of IoT objects. Developments towards heterogeneous IoT objects will enable increased protections for devices and users against malicious attacks, hazards from malfunctions, or health-related critical issues.

# INTERNET OF THINGS (IoT) – AUTONOMOUS IoT OBJECT IDENTIFICATION IN A CONNECTED HOME – REQUIREMENTS AND FRAMEWORK

## 1 Scope

This document specifies the following items for the autonomous IoT object identification in a connected home:

– requirements;

– architecture, functional entities and interfaces;

– operation procedures.

Information model formats, data formats, and identifier assignment are out of scope of this document.

## 2 Normative references

There are no normative references in this document.
