Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents) or the IEC list of patent declarations received (see patents.iec.ch).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by the Linux Foundation as Linux Standard Base (LSB): Core specification generic part and drafted in accordance with its editorial rules. It was assigned to Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 22, *Programming languages, their environments and system software interfaces*, and adopted by National Bodies.

This first edition of ISO/IEC 23360-1-2 cancels and replaces ISO/IEC 23360-1:2006, which has been technically revised.

This document is based on “The GNU Free Documentation License, version 1.1”. The license is available at <https://www.gnu.org/licenses/old-licenses/fdl-1.1.html>.

A list of all parts in the ISO/IEC 23660 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

The LSB defines a binary interface for application programs that are compiled and packaged for LSB-conforming implementations on many different hardware architectures. A binary specification must include information specific to the computer processor architecture for which it is intended. To avoid the complexity of conditional descriptions, the specification has instead been divided into generic parts which are augmented by one of several architecture-specific parts, depending on the target processor architecture; the generic part will indicate when reference must be made to the architecture part, and vice versa.

This document should be used in conjunction with the documents it references. This document enumerates the system components it includes, but descriptions of those components may be included entirely or partly in this document, partly in other documents, or entirely in other reference documents. For example, the section that describes system service routines includes a list of the system routines supported in this interface, formal declarations of the data structures they use that are visible to applications, and a pointer to the underlying referenced specification for information about the syntax and semantics of each call. Only those routines not described in standards referenced by this document, or extensions to those standards, are described in the detail. Information referenced in this way is as much a part of this document as is the information explicitly included here.

The specification carries a version number of either the form $x.y$ or $x.y.z$. This version number carries the following meaning:

1. The first number (x) is the major version number. Versions sharing the same major version number shall be compatible in a backwards direction; that is, a newer version shall be compatible with an older version. Any deletion of a library results in a new major version number. Interfaces marked as deprecated may be removed from the specification at a major version change.
2. The second number (y) is the minor version number. Libraries and individual interfaces may be added, but not removed. Interfaces may be marked as deprecated at a minor version change. Other minor changes may be permitted at the discretion of the LSB workgroup.
3. The third number (z), if present, is the editorial level. Only editorial changes should be included in such versions.

Since this specification is a descriptive Application Binary Interface, and not a source level API specification, it is not possible to make a guarantee of 100% backward compatibility between major releases. However, it is the intent that those parts of the binary interface that are visible in the source level API will remain backward compatible from version to version, except where a feature marked as "Deprecated" in one release may be removed from a future release. Implementors are strongly encouraged to make use of symbol versioning to permit simultaneous support of applications conforming to different releases of this specification.

LSB is a trademark of the Linux Foundation. Developers of applications or implementations interested in using the trademark should see the Linux Foundation Certification Policy for details.

I Introductory Elements

1 Scope

The Linux Standard Base (LSB) defines a system interface for compiled applications and a minimal environment for support of installation scripts. Its purpose is to enable a uniform industry standard environment for high-volume applications conforming to the LSB.

These specifications are composed of two basic parts: a common part describing those parts of the interface that remain constant across all implementations of the LSB, and an architecture-specific part describing the parts of the interface that vary by processor architecture. Together, the common part and the relevant architecture-specific part for a single hardware architecture provide a complete interface specification for compiled application programs on systems that share a common hardware architecture.

The LSB contains both a set of Application Program Interfaces (APIs) and Application Binary Interfaces (ABIs). APIs may appear in the source code of portable applications, while the compiled binary of that application may use the larger set of ABIs. A conforming implementation provides all of the ABIs listed here. The compilation system may replace (e.g. by macro definition) certain APIs with calls to one or more of the underlying binary interfaces, and may insert calls to binary interfaces as needed.

The LSB is primarily a binary interface definition. Not all of the source level APIs available to applications may be contained in this specification.

This is the common part of the Core module of the Linux Standard Base (LSB), LSB Core - Generic. This module provides the fundamental system interfaces, libraries, and runtime environment upon which all conforming applications and libraries depend.

LSB Core - Generic, the common part, should be used in conjunction with an architecture-specific part. Whenever a section of the common part is supplemented by architecture-specific information, the common part includes a reference to the architecture-specific part. Architecture-specific parts of the LSB Core Specification may also contain additional information that is not referenced in the common part.

Interfaces described in this part of the LSB Core Specification are mandatory except where explicitly listed otherwise. Interfaces described in the LSB Core module are supplemented by other LSB modules. All other modules depend on the presence of LSB Core.

2 References

2.1 Normative References

The following specifications are incorporated by reference into this specification. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced specification (including any amendments) applies.

Note: Where copies of a referenced specification are available on the World Wide Web, a Uniform Resource Locator (URL) is given, for informative purposes only. Such URL might at any given time resolve to a more recent copy of the specification, or be out of date (not resolve). Reference copies of specifications at the revision level indicated may be found at the Linux Foundation's Reference Specifications (<http://refspecs.linuxbase.org>) site.

3 Requirements

3.1 Relevant Libraries

The libraries listed in Table 3-1 shall be available on a Linux Standard Base system, with the specified runtime names. The libraries listed in Table 3-2 are architecture specific, but shall be available on all LSB conforming systems. This list may be supplemented or amended by the relevant architecture specific part of the LSB Core Specification.

Table 3-1 Standard Library Names

Library	Runtime Name
libcrypt	libcrypt.so.1
libdl	libdl.so.2
libgcc_s	libgcc_s.so.1
libncurses	libncurses.so.5
libncursesw	libncursesw.so.5
libnspr4	libnspr4.so
libnss3	libnss3.so
libpam	libpam.so.0
libpthread	libpthread.so.0
librt	librt.so.1
libssl3	libssl3.so
libstdc++	libstdc++.so.6
libutil	libutil.so.1
libz	libz.so.1

Table 3-2 Standard Library Names defined in the Architecture Specific Parts of the LSB Core Specification

Library	Runtime Name
libc	See architecture specific part.
libm	See architecture specific part.
proginterp	See architecture specific part.

These libraries will be in an implementation-defined directory which the dynamic linker shall search by default.

3.2 LSB Implementation Conformance

A conforming implementation is necessarily architecture specific, and must provide the interfaces specified by both the generic LSB Core specification (LSB

Core - Generic) and the relevant architecture specific part of the LSB Core Specification.

Rationale: An implementation must provide *at least* the interfaces specified in these specifications. It may also provide additional interfaces.

A conforming implementation shall satisfy the following requirements:

- A processor architecture represents a family of related processors which may not have identical feature sets. The architecture specific parts of the LSB Core Specification that supplement this specification for a given target processor architecture describe a minimum acceptable processor. The implementation shall provide all features of this processor, whether in hardware or through emulation transparent to the application.
- The implementation shall be capable of executing compiled applications having the format and using the system interfaces described in this specification.
- The implementation shall provide libraries containing the interfaces specified by this specification, and shall provide a dynamic linking mechanism that allows these interfaces to be attached to applications at runtime. All the interfaces shall behave as specified in this specification.
- The map of virtual memory provided by the implementation shall conform to the requirements of this specification.
- The implementation's low-level behavior with respect to function call linkage, system traps, signals, and other such activities shall conform to the formats described in this specification.
- The implementation shall provide all of the mandatory interfaces in their entirety.
- The implementation may provide one or more of the optional interfaces. Each optional interface that is provided shall be provided in its entirety. The product documentation shall state which optional interfaces are provided.
- The implementation shall provide all files and utilities specified as part of this specification in the format defined here and in other documents normatively included by reference. All commands and utilities shall behave as required by this specification. The implementation shall also provide all mandatory components of an application's runtime environment that are included or referenced in this specification.
- The implementation, when provided with standard data formats and values at a named interface, shall provide the behavior defined for those values and data formats at that interface. However, a conforming implementation may consist of components which are separately packaged and/or sold. For example, a vendor of a conforming implementation might sell the hardware, operating system, and windowing system as separately packaged items.
- The implementation may provide additional interfaces with different names. It may also provide additional behavior corresponding to data values outside the standard ranges, for standard named interfaces.

3.3 LSB Application Conformance

A conforming application containing object files is necessarily architecture specific, and must conform to both the generic LSB Core specification (LSB Core - Generic) and the relevant architecture specific part of the LSB Core Specification. A conforming application which contains no object files may be architecture neutral. Architecture neutral applications shall conform only to the requirements of the generic LSB Core specification (LSB Core - Generic).

A conforming application shall satisfy the following requirements:

- Executable files shall be either object files in the format defined in the Object Format section of this specification, or script files in a scripting language where the interpreter is required by this specification.
- Object files shall participate in dynamic linking as defined in the Program Loading and Linking section of this specification.
- Object files shall employ only the instructions, traps, and other low-level facilities defined as being for use by applications in the Low-Level System Information section of this specification
- If the application requires any optional interface defined in this specification in order to be installed or to execute successfully, the requirement for that optional interface shall be stated in the application's documentation.
- The application shall not use any interface or data format that is not required to be provided by a conforming implementation, unless such an interface or data format is supplied by another application through direct invocation of that application during execution. The other application must also be a conforming application, and the use of such interface or data format, as well as its source (in other words, the other conforming application), shall be identified in the documentation of the application.
- The application shall not use any values for a named interface that are reserved for vendor extensions.

A strictly conforming application shall not require or use any interface, facility, or implementation-defined extension not defined in this specification in order to be installed or to execute successfully.

4 Terms and Definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 2382, ISO 80000-2, and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

4.1

archLSB

Some LSB specification documents have both a generic, architecture-neutral part and an architecture-specific part. The latter describes elements whose definitions may be unique to a particular processor architecture. The term archLSB may be used in the generic part to refer to the corresponding section of the architecture-specific part.

4.2

Binary Standard, ABI

The total set of interfaces that are available to be used in the compiled binary code of a conforming application, including the run-time details such as calling conventions, binary format, C++ name mangling, etc.

4.3

Implementation-defined

Describes a value or behavior that is not defined by this document but is selected by an implementor. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations. The implementor shall document such a value or behavior so that it can be used correctly by an application.

4.4

Shell Script

A file that is read by an interpreter (e.g., awk). The first line of the shell script includes a reference to its interpreter binary.

4.5

Source Standard, API

The total set of interfaces that are available to be used in the source code of a conforming application. Due to translations, the Binary Standard and the Source Standard may contain some different interfaces.

4.6

Undefined

Describes the nature of a value or behavior not defined by this document which results from use of an invalid program construct or invalid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

4.7

Unspecified

Describes the nature of a value or behavior not specified by this document which results from use of a valid program construct or valid data input. The value or behavior may vary among implementations that conform to this document. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

In addition, for the portions of this specification which build on IEEE Std 1003.1-2001, the definitions given in *IEEE Std 1003.1-2001, Base Definitions, Chapter 3* apply.

5 Documentation Conventions

Throughout this document, the following typographic conventions are used:

`function()`

the name of a function

command

the name of a command or utility

CONSTANT

a constant value

parameter

a parameter

variable

a variable

Throughout this specification, several tables of interfaces are presented. Each entry in these tables has the following format:

name

the name of the interface

(symver)

An optional symbol version identifier, if required.

[*refno*]

A reference number indexing the table of referenced specifications that follows this table.

For example,

forkpty(GLIBC_2.0) [SUSv4]

refers to the interface named `forkpty()` with symbol version `GLIBC_2.0` that is defined in the reference indicated by the tag `SUSv4`.

Note: For symbols with versions which differ between architectures, the symbol versions are defined in the architecture specific parts of of this module specification only. In the generic part, they will appear without symbol versions.

6 Relationship To ISO/IEC 9945 POSIX

This specification includes many interfaces described in POSIX 1003.1-2008 (ISO/IEC 9945-2009). Unless otherwise specified, such interfaces should behave exactly as described in that specification. Any conflict between the requirements described here and the POSIX 1003.1-2008 (ISO/IEC 9945-2009) standard is unintentional, except as explicitly noted otherwise.

Note: In addition to the differences noted in this specification, a report, *ISO/IEC TR 24715-Technical Report on the Conflicts Between the ISO/IEC 9945 (POSIX) Standard and the Linux Standard Base Specification (LSB)*, identifies the differences between edition 3.1 of this specification and *POSIX 1003.1-2001 (ISO/IEC 9945-2003)* (more precisely, POSIX 2001 plus the first two corrigenda, informally known as the 2004 edition). It is the long term plan of the Linux Foundation to converge the LSB Core specification with the ISO/IEC POSIX specification.

The LSB Specification Authority is responsible for deciding the meaning of conformance to normative referenced standards in the LSB context. Problem reports regarding underlying or referenced standards in any other context will be referred to the relevant maintenance body for that standard.

7 Relationship To Other Linux Foundation Specifications

The LSB is the base for several other specification projects under the umbrella of the Linux Foundation (LF). This specification is the foundation, and other specifications build on the interfaces defined here. However, beyond those specifications listed as Normative References, this specification has no dependencies on other LF projects.

ISO/IEC 23360 corresponds to an earlier edition of this specification (version 3.1), published as an ISO/IEC standard in 2006 after submission by the Linux Foundation. The ISO edition is also the subject of the technical report ISO/IEC TR 24715 referenced in the previous chapter.

II Executable And Linking Format (ELF)

8 Introduction

Executable and Linking Format (ELF) defines the object format for compiled applications. This specification supplements the information found in System V ABI Update and is intended to document additions made since the publication of that document.

9 Low Level System Information

9.1 Operating System Interface

LSB-conforming applications shall assume that stack, heap and other allocated memory regions will be non-executable. The application must take steps to make them executable if needed.

9.2 Machine Interface

9.2.1 Data Representation

LSB-conforming applications shall use the data representation as defined in the Architecture specific ELF documents.

9.2.1.1 Fundamental Types

In addition to the fundamental types specified in the relevant architecture specific part of the LSB Core Specification, a 1 byte data type is defined here.

Table 9-1 Scalar Types

Type	C	C++	sizeof	Align- ment (bytes)	Architec- ture Rep- resenta- tion
Integral	_Bool	bool	1	1	byte

10 Object Format

10.1 Object Files

LSB-conforming implementations shall support the Executable and Linking Format (ELF) object file format as defined by the following documents:

- System V ABI
- System V ABI Update
- the relevant architecture specific ABI supplement.
- this specification
- the relevant architecture specific part of the LSB Core Specification

Conforming implementations may also support other unspecified object file formats.

10.2 Sections

10.2.1 Introduction

As described in System V ABI, an ELF object file contains a number of *sections*.

10.2.2 Sections Types

The section header table is an array of `Elf32_Shdr` or `Elf64_Shdr` structures as described in System V ABI. The *sh_type* member shall be either a value from Table 10-1, drawn from the System V ABI, or one of the additional values specified in Table 10-2.

A section header's *sh_type* member specifies the sections's semantics.

10.2.2.1 ELF Section Types

The following section types are defined in the System V ABI and the System V ABI Update.

Table 10-1 ELF Section Types

Name	Value	Description
SHT_DYNAMIC	0x6	The section holds information for dynamic linking. Currently, an object file shall have only one dynamic section, but this restriction may be relaxed in the future. See 'Dynamic Section' in Chapter 5 of System V ABI Update for details.
SHT_DYNSYM	0xb	This section holds a minimal set of symbols adequate for dynamic

Name	Value	Description
		linking. See also SHT_SYMTAB. Currently, an object file may have either a section of SHT_SYMTAB type or a section of SHT_DYNSYM type, but not both. This restriction may be relaxed in the future.
SHT_FINI_ARRAY	0xf	This section contains an array of pointers to termination functions, as described in 'Initialization and Termination Functions' in Chapter 5 of System V ABI Update. Each pointer in the array is taken as a parameterless procedure with a void return.
SHT_HASH	0x5	The section holds a symbol hash table. Currently, an object file shall have only one hash table, but this restriction may be relaxed in the future. See 'Hash Table' in Chapter 5 of System V ABI Update for details.
SHT_INIT_ARRAY	0xe	This section contains an array of pointers to initialization functions, as described in 'Initialization and Termination Functions' in Chapter 5 of System V ABI Update. Each pointer in the array is taken as a parameterless procedure with a void return.
SHT_NOBITS	0x8	A section of this type occupies no space in the file but otherwise re-

Name	Value	Description
		sembles SHT_PROG-BITS. Although this section contains no bytes, the sh_offset member contains the conceptual file offset.
SHT_NOTE	0x7	The section holds information that marks the file in some way. See 'Note Section' in Chapter 5 of System V ABI Update for details.
SHT_NULL	0x0	This value marks the section header as inactive; it does not have an associated section. Other members of the section header have undefined values.
SHT_PREINIT_ARRAY	0x10	This section contains an array of pointers to functions that are invoked before all other initialization functions, as described in 'Initialization and Termination Functions' in Chapter 5 of System V ABI Update. Each pointer in the array is taken as a parameterless procedure with a void return.
SHT_PROGBITS	0x1	The section holds information defined by the program, whose format and meaning are determined solely by the program.
SHT_REL	0x9	The section holds relocation entries without explicit addends, such as type Elf32_Rel for the 32-bit class of object files or type Elf64_Rel for the 64-bit class of object files. An object

Name	Value	Description
		file may have multiple relocation sections. See 'Relocation' in Chapter 4 of System V ABI Update for details.
SHT_REL	0x4	The section holds relocation entries with explicit addends, such as type Elf32_Rela for the 32-bit class of object files or type Elf64_Rela for the 64-bit class of object files. An object file may have multiple relocation sections. See 'Relocation' in Chapter 4 of System V ABI Update for details.
SHT_STRTAB	0x3	The section holds a string table. An object file may have multiple string table sections. See 'String Table' in Chapter 4 of System V ABI Update for details.
SHT_SYMTAB	0x2	This section holds a symbol table. Currently, an object file may have either a section of SHT_SYMTAB type or a section of SHT_DYNSYM type, but not both. This restriction may be relaxed in the future. Typically, SHT_SYMTAB provides symbols for link editing, though it may also be used for dynamic linking. As a complete symbol table, it may contain many symbols unnecessary for dynamic linking.

10.2.2.2 Additional Section Types

The following additional section types are defined here.

Table 10-2 Additional Section Types

Name	Value	Description
SHT_GNU_verdef	0x6ffffffd	This section contains the symbol versions that are provided.
SHT_GNU_verneed	0x6ffffffe	This section contains the symbol versions that are required.
SHT_GNU_versym	0x6fffffff	This section contains the Symbol Version Table.

10.3 Special Sections

10.3.1 Special Sections

Various sections hold program and control information. Sections in the lists below are used by the system and have the indicated types and attributes.

10.3.1.1 ELF Special Sections

The following sections are defined in the System V ABI and the System V ABI Update.

Table 10-3 ELF Special Sections

Name	Type	Attributes
.bss	SHT_NOBITS	SHF_AL- LOC+SHF_WRITE
.comment	SHT_PROGBITS	SHF_MERGE+SHF_STRINGS
.data	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.data1	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.debug	SHT_PROGBITS	0
.dynamic	SHT_DYNAMIC	SHF_AL- LOC+SHF_WRITE
.dynstr	SHT_STRTAB	SHF_ALLOC
.dynsym	SHT_DYNSYM	SHF_ALLOC
.fini	SHT_PROGBITS	SHF_ALLOC+SHF_EXECINSTR
.fini_array	SHT_FINI_ARRAY	SHF_AL- LOC+SHF_WRITE

Name	Type	Attributes
.hash	SHT_HASH	SHF_ALLOC
.init	SHT_PROGBITS	SHF_ALLOC+SHF_EXECINSTR
.init_array	SHT_INIT_ARRAY	SHF_ALLOC+SHF_WRITE
.interp	SHT_PROGBITS	SHF_ALLOC
.line	SHT_PROGBITS	0
.note	SHT_NOTE	0
.preinit_array	SHT_PREINIT_ARRAY	SHF_ALLOC+SHF_WRITE
.rodata	SHT_PROGBITS	SHF_ALLOC+SHF_MERGE+SHF_STRINGS
.rodata1	SHT_PROGBITS	SHF_ALLOC+SHF_MERGE+SHF_STRINGS
.shstrtab	SHT_STRTAB	0
.strtab	SHT_STRTAB	SHF_ALLOC
.symtab	SHT_SYMTAB	SHF_ALLOC
.tbss	SHT_NOBITS	SHF_ALLOC+SHF_WRITE+SHF_TLS
.tdata	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE+SHF_TLS
.text	SHT_PROGBITS	SHF_ALLOC+SHF_EXECINSTR

.bss

This section holds data that contributes to the program's memory image. The program may treat this data as uninitialized. However, the system shall initialize this data with zeroes when the program begins to run. The section occupies no file space, as indicated by the section type, SHT_NOBITS.

.comment

This section holds version control information.

.data

This section holds initialized data that contribute to the program's memory image.

.data1

This section holds initialized data that contribute to the program's memory image.

.debug

This section holds information for symbolic debugging. The contents are unspecified. All section names with the prefix `.debug` hold information for symbolic debugging. The contents of these sections are unspecified.

.dynamic

This section holds dynamic linking information. The section's attributes will include the `SHF_ALLOC` bit. Whether the `SHF_WRITE` bit is set is processor specific. See Chapter 5 of System V ABI Update for more information.

.dynstr

This section holds strings needed for dynamic linking, most commonly the strings that represent the names associated with symbol table entries. See Chapter 5 of System V ABI Update for more information.

.dynsym

This section holds the dynamic linking symbol table, as described in 'Symbol Table' of System V ABI Update.

.fini

This section holds executable instructions that contribute to the process termination code. That is, when a program exits normally, the system arranges to execute the code in this section.

.fini_array

This section holds an array of function pointers that contributes to a single termination array for the executable or shared object containing the section.

.hash

This section holds a symbol hash table. See 'Hash Table' in Chapter 5 of System V ABI Update for more information.

.init

This section holds executable instructions that contribute to the process initialization code. When a program starts to run, the system arranges to execute the code in this section before calling the main program entry point (called `main` for C programs).

.init_array

This section holds an array of function pointers that contributes to a single initialization array for the executable or shared object containing the section.

.interp

This section holds the path name of a program interpreter. If the file has a loadable segment that includes relocation, the sections' attributes will include the SHF_ALLOC bit; otherwise, that bit will be off. See Chapter 5 of System V ABI Update for more information.

.line

This section holds line number information for symbolic debugging, which describes the correspondence between the source program and the machine code. The contents are unspecified.

.note

This section holds information in the format that 'Note Section' in Chapter 5 of System V ABI Update describes.

.preinit_array

This section holds an array of function pointers that contributes to a single pre-initialization array for the executable or shared object containing the section.

.rodata

This section holds read-only data that typically contribute to a non-writable segment in the process image. See 'Program Header' in Chapter 5 of System V ABI Update for more information.

.rodata1

This section holds read-only data that typically contribute to a non-writable segment in the process image. See 'Program Header' in Chapter 5 of System V ABI Update for more information.

.shstrtab

This section holds section names.

.strtab

This section holds strings, most commonly the strings that represent the names associated with symbol table entries. If the file has a loadable segment that includes the symbol string table, the section's attributes will include the SHF_ALLOC bit; otherwise, that bit will be off.

.symtab

This section holds a symbol table, as 'Symbol Table' in Chapter 4 of System V ABI Update describes. If the file has a loadable segment that includes the symbol table, the section's attributes will include the SHF_ALLOC bit; otherwise, that bit will be off.

.tbss

This section holds uninitialized thread-local data that contribute to the program's memory image. By definition, the system initializes the data with zeros when the data is instantiated for each new execution flow. The section

occupies no file space, as indicated by the section type, SHT_NOBITS. Implementations need not support thread-local storage.

.tdata

This section holds initialized thread-local data that contributes to the program's memory image. A copy of its contents is instantiated by the system for each new execution flow. Implementations need not support thread-local storage.

.text

This section holds the 'text', or executable instructions, of a program.

10.3.1.2 Additional Special Sections

Object files in an LSB conforming application may also contain one or more of the additional special sections described below.

Table 10-4 Additional Special Sections

Name	Type	Attributes
.ctors	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.data.rel.ro	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.dtors	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.eh_frame	SHT_PROGBITS	SHF_ALLOC
.eh_frame_hdr	SHT_PROGBITS	SHF_ALLOC
.gcc_except_table	SHT_PROGBITS	SHF_ALLOC
.gnu.version	SHT_GNU_versym	SHF_ALLOC
.gnu.version_d	SHT_GNU_verdef	SHF_ALLOC
.gnu.version_r	SHT_GNU_verneed	SHF_ALLOC
.got.plt	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.jcr	SHT_PROGBITS	SHF_AL- LOC+SHF_WRITE
.note.ABI-tag	SHT_NOTE	SHF_ALLOC
.stab	SHT_PROGBITS	0
.stabstr	SHT_STRTAB	0

.ctors

This section contains a list of global constructor function pointers.

`.data.rel.ro`

This section holds initialized data that contribute to the program's memory image. This section may be made read-only after relocations have been applied.

`.dtors`

This section contains a list of global destructor function pointers.

`.eh_frame`

This section contains information necessary for frame unwinding during exception handling. See Section 10.6.1.

`.eh_frame_hdr`

This section contains a pointer to the `.eh_frame` section which is accessible to the runtime support code of a C++ application. This section may also contain a binary search table which may be used by the runtime support code to more efficiently access records in the `.eh_frame` section. See Section 10.6.2.

`.gcc_except_table`

This section holds Language Specific Data.

`.gnu.version`

This section contains the Symbol Version Table. See Section 10.7.2.

`.gnu.version_d`

This section contains the Version Definitions. See Section 10.7.3.

`.gnu.version_r`

This section contains the Version Requirements. See Section 10.7.4.

`.got.plt`

This section holds the read-only portion of the Global Offset Table. This section may be made read-only after relocations have been applied.

`.jcr`

This section contains information necessary for registering compiled Java classes. The contents are compiler-specific and used by compiler initialization functions.

`.note.ABI-tag`

Specify ABI details. See Section 10.8.

`.stab`

This section contains debugging information. The contents are not specified as part of the LSB.

.stabstr

This section contains strings associated with the debugging information contained in the .stab section.

10.4 Symbol Mapping

10.4.1 Introduction

Symbols in a source program are translated by the compilation system into symbols that exist in the object file.

10.4.1.1 C Language

External C symbols shall be unchanged in an object file's symbol table.

10.5 DWARF Extensions

The LSB does not specify debugging information, however, some additional sections contain information which is encoded using the the encoding as specified by DWARF Debugging Information Format, Version 4 with extensions defined here.

10.5.1 DWARF Exception Header Encoding

The DWARF Exception Header Encoding is used to describe the type of data used in the `.eh_frame` and `.eh_frame_hdr` section. The upper 4 bits indicate how the value is to be applied. The lower 4 bits indicate the format of the data.

Table 10-5 DWARF Exception Header value format

Name	Value	Meaning
DW_EH_PE_absptr	0x00	The Value is a literal pointer whose size is determined by the architecture.
DW_EH_PE_uleb128	0x01	Unsigned value is encoded using the Little Endian Base 128 (LEB128) as defined by DWARF Debugging Information Format, Version 4.
DW_EH_PE_udata2	0x02	A 2 bytes unsigned value.
DW_EH_PE_udata4	0x03	A 4 bytes unsigned value.
DW_EH_PE_udata8	0x04	An 8 bytes unsigned value.
DW_EH_PE_sleb128	0x09	Signed value is encoded using the Little Endian

Name	Value	Meaning
		Base 128 (LEB128) as defined by DWARF Debugging Information Format, Version 4.
DW_EH_PE_sdata2	0x0A	A 2 bytes signed value.
DW_EH_PE_sdata4	0x0B	A 4 bytes signed value.
DW_EH_PE_sdata8	0x0C	An 8 bytes signed value.

Table 10-6 DWARF Exception Header application

Name	Value	Meaning
DW_EH_PE_pcrel	0x10	Value is relative to the current program counter.
DW_EH_PE_textrel	0x20	Value is relative to the beginning of the .text section.
DW_EH_PE_datarel	0x30	Value is relative to the beginning of the .got or .eh_frame_hdr section.
DW_EH_PE_funcrel	0x40	Value is relative to the beginning of the function.
DW_EH_PE_aligned	0x50	Value is aligned to an address unit sized boundary.

One special encoding, 0xff (DW_EH_PE_omit), shall be used to indicate that no value is present.

10.5.2 DWARF CFI Extensions

In addition to the Call Frame Instructions defined in section 6.4.2 of DWARF Debugging Information Format, Version 4, the following additional Call Frame Instructions may also be used.

Table 10-7 Additional DWARF Call Frame Instructions

Name	Value	Meaning
DW_CFA_GNU_args_size	0x2e	The DW_CFA_GNU_args_size instruction takes an unsigned LEB128 operand representing

Name	Value	Meaning
		an argument size. This instruction specifies the total of the size of the arguments which have been pushed onto the stack.
DW_CFA_GNU_negative_offset_extended	0x2f	The DW_CFA_def_cfa_sf instruction takes two operands: an unsigned LEB128 value representing a register number and an unsigned LEB128 which represents the magnitude of the offset. This instruction is identical to DW_CFA_offset_extended_sf except that the operand is subtracted to produce the offset. This instructions is obsoleted by DW_CFA_offset_extended_sf.

10.6 Exception Frames

When using languages that support exceptions, such as C++, additional information must be provided to the runtime environment that describes the call frames that must be unwound during the processing of an exception. This information is contained in the special sections `.eh_frame` and `.eh_framehdr`.

Note: The format of the `.eh_frame` section is similar in format and purpose to the `.debug_frame` section which is specified in DWARF Debugging Information Format, Version 4. Readers are advised that there are some subtle difference, and care should be taken when comparing the two sections.

10.6.1 The `.eh_frame` section

The `.eh_frame` section shall contain 1 or more Call Frame Information (CFI) records. The number of records present shall be determined by size of the section as contained in the section header. Each CFI record contains a Common Information Entry (CIE) record followed by 1 or more Frame Description Entry (FDE) records. Both CIEs and FDEs shall be aligned to an addressing unit sized boundary.

Table 10-8 Call Frame Information Format

Common Information Entry Record
Frame Description Entry Record(s)

10.6.1.1 The Common Information Entry Format**Table 10-9 Common Information Entry Format**

Length	Required
Extended Length	Optional
CIE ID	Required
Version	Required
Augmentation String	Required
Code Alignment Factor	Required
Data Alignment Factor	Required
Return Address Register	Required
Augmentation Data Length	Optional
Augmentation Data	Optional
Initial Instructions	Required
Padding	

Length

A 4 byte unsigned value indicating the length in bytes of the CIE structure, not including the *Length* field itself. If *Length* contains the value 0xffffffff, then the length is contained in the *Extended Length* field. If *Length* contains the value 0, then this CIE shall be considered a terminator and processing shall end.

Extended Length

A 8 byte unsigned value indicating the length in bytes of the CIE structure, not including the *Length* and *Extended Length* fields themselves. This field is not present unless the *Length* field contains the value 0xffffffff.

CIE ID

A 4 byte unsigned value that is used to distinguish CIE records from FDE records. This value shall always be 0, which indicates this record is a CIE.

Version

A 1 byte value that identifies the version number of the frame information structure. This value shall be 1.

Augmentation String

This value is a NUL terminated string that identifies the augmentation to the CIE or to the FDEs associated with this CIE. A zero length string indicates

that no augmentation data is present. The augmentation string is case sensitive and shall be interpreted as described below.

Code Alignment Factor

An unsigned LEB128 encoded value that is factored out of all advance location instructions that are associated with this CIE or its FDEs. This value shall be multiplied by the delta argument of an advance location instruction to obtain the new location value.

Data Alignment Factor

A signed LEB128 encoded value that is factored out of all offset instructions that are associated with this CIE or its FDEs. This value shall be multiplied by the register offset argument of an offset instruction to obtain the new offset value.

Augmentation Length

An unsigned LEB128 encoded value indicating the length in bytes of the Augmentation Data. This field is only present if the Augmentation String contains the character 'z'.

Augmentation Data

A block of data whose contents are defined by the contents of the Augmentation String as described below. This field is only present if the Augmentation String contains the character 'z'. The size of this data is given by the Augmentation Length.

Initial Instructions

Initial set of Call Frame Instructions. The number of instructions is determined by the remaining space in the CIE record.

Padding

Extra bytes to align the CIE structure to an addressing unit size boundary.

10.6.1.1.1 Augmentation String Format

The Augmentation String indicates the presence of some optional fields, and how those fields should be interpreted. This string is case sensitive. Each character in the augmentation string in the CIE can be interpreted as below:

'z'

A 'z' may be present as the first character of the string. If present, the Augmentation Data field shall be present. The contents of the Augmentation Data shall be interpreted according to other characters in the Augmentation String.

'L'

A 'L' may be present at any position after the first character of the string. This character may only be present if 'z' is the first character of the string. If present, it indicates the presence of one argument in the Augmentation Data of the CIE, and a corresponding argument in the Augmentation Data of the FDE. The argument in the Augmentation Data of the CIE is 1-byte and

represents the pointer encoding used for the argument in the Augmentation Data of the FDE, which is the address of a language-specific data area (LSDA). The size of the LSDA pointer is specified by the pointer encoding used.

'P'

A 'P' may be present at any position after the first character of the string. This character may only be present if 'z' is the first character of the string. If present, it indicates the presence of two arguments in the Augmentation Data of the CIE. The first argument is 1-byte and represents the pointer encoding used for the second argument, which is the address of a *personality routine* handler. The personality routine is used to handle language and vendor-specific tasks. The system unwind library interface accesses the language-specific exception handling semantics via the pointer to the personality routine. The personality routine does not have an ABI-specific name. The size of the personality routine pointer is specified by the pointer encoding used.

'R'

A 'R' may be present at any position after the first character of the string. This character may only be present if 'z' is the first character of the string. If present, The Augmentation Data shall include a 1 byte argument that represents the pointer encoding for the address pointers used in the FDE.

10.6.1.2 The Frame Description Entry Format

Table 10-10 Frame Description Entry Format

Length	Required
Extended Length	Optional
FDE Pointer	Required
PC Begin	Required
PC Range	Required
Augmentation Data Length	Optional
Augmentation Data	Optional
Call Frame Instructions	Required
Padding	

Length

A 4 byte unsigned value indicating the length in bytes of the FDE structure, not including the *Length* field itself. If *Length* contains the value 0xffffffff, then the length is contained the *Extended Length* field. If *Length* contains the value 0, then this FDE shall be considered a terminator and processing shall end.

Extended Length

A 8 byte unsigned value indicating the length in bytes of the FDE structure, not including the *Length* or *Extended Length* field themselves. This field is not present unless the *Length* field contains the value 0xffffffff.

CIE Pointer

A 4 byte unsigned value that when subtracted from the offset of the CIE Pointer in the current FDE yields the offset of the start of the associated CIE. This value shall never be 0.

PC Begin

An encoded value that indicates the address of the initial location associated with this FDE. The encoding format is specified in the Augmentation Data.

PC Range

An absolute value that indicates the number of bytes of instructions associated with this FDE.

Augmentation Length

An unsigned LEB128 encoded value indicating the length in bytes of the Augmentation Data. This field is only present if the Augmentation String in the associated CIE contains the character 'z'.

Augmentation Data

A block of data whose contents are defined by the contents of the Augmentation String in the associated CIE as described above. This field is only present if the Augmentation String in the associated CIE contains the character 'z'. The size of this data is given by the Augmentation Length.

Call Frame Instructions

A set of Call Frame Instructions.

Padding

Extra bytes to align the FDE structure to an addressing unit size boundary.

10.6.2 The `.eh_frame_hdr` section

The `.eh_frame_hdr` section contains additional information about the `.eh_frame` section. A pointer to the start of the `.eh_frame` data, and optionally, a binary search table of pointers to the `.eh_frame` records are found in this section.

Data in this section is encoded according to Section 10.5.1.

Table 10-11 `.eh_frame_hdr` Section Format

Encoding	Field
unsigned byte	version
unsigned byte	eh_frame_ptr_enc
unsigned byte	fde_count_enc

Encoding	Field
unsigned byte	table_enc
encoded	eh_frame_ptr
encoded	fde_count
	binary search table

version

Version of the `.eh_frame_hdr` format. This value shall be 1.

eh_frame_ptr_enc

The encoding format of the `eh_frame_ptr` field.

fde_count_enc

The encoding format of the `fde_count` field. A value of `DW_EH_PE_omit` indicates the binary search table is not present.

table_enc

The encoding format of the entries in the binary search table. A value of `DW_EH_PE_omit` indicates the binary search table is not present.

eh_frame_ptr

The encoded value of the pointer to the start of the `.eh_frame` section.

fde_count

The encoded value of the count of entries in the binary search table.

binary search table

A binary search table containing `fde_count` entries. Each entry of the table consist of two encoded values, the initial location, and the address. The entries are sorted in an increasing order by the initial location value.

10.7 Symbol Versioning

10.7.1 Introduction

This chapter describes the Symbol Versioning mechanism. All ELF objects may provide or depend on versioned symbols. Symbol Versioning is implemented by 3 section types: `SHT_GNU_versym`, `SHT_GNU_verdef`, and `SHT_GNU_verneed`.

The prefix `Elfxx` in the following descriptions and code fragments stands for either `"Elf32"` or `"Elf64"`, depending on the architecture.

Versions are described by strings. The structures that are used for symbol versions also contain a member that holds the ELF hashing values of the strings. This allows for more efficient processing.

10.7.2 Symbol Version Table

The special section `.gnu.version` which has a section type of `SHT_GNU_verSYM` shall contain the Symbol Version Table. This section shall have the same number of entries as the Dynamic Symbol Table in the `.dynSYM` section.

The `.gnu.version` section shall contain an array of elements of type `Elfxx_Half`. Each entry specifies the version defined for or required by the corresponding symbol in the Dynamic Symbol Table.

The values in the Symbol Version Table are specific to the object in which they are located. These values are identifiers that are provided by the `vna_other` member of the `Elfxx_VerNaux` structure or the `vd_ndx` member of the `Elfxx_VerDef` structure.

The values 0 and 1 are reserved.

0

The symbol is local, not available outside the object.

1

The symbol is defined in this object and is globally available.

All other values are used to identify version strings located in one of the other Symbol Version sections. The value itself is not the version associated with the symbol. The string identified by the value defines the version of the symbol.

10.7.3 Version Definitions

The special section `.gnu.version_d` which has a section type of `SHT_GNU_verDef` shall contain symbol version definitions. The number of entries in this section shall be contained in the `DT_VERDEFNUM` entry of the Dynamic Section `.dynamic`. The `sh_link` member of the section header (see figure 4-8 in the System V ABI) shall point to the section that contains the strings referenced by this section.

The section shall contain an array of `Elfxx_VerDef` structures, as described in Figure 10-1, optionally followed by an array of `Elfxx_VerNaux` structures, as defined in Figure 10-2.

```
typedef struct {
    Elfxx_Half    vd_version;
    Elfxx_Half    vd_flags;
    Elfxx_Half    vd_ndx;
    Elfxx_Half    vd_cnt;
    Elfxx_Word    vd_hash;
    Elfxx_Word    vd_aux;
    Elfxx_Word    vd_next;
} Elfxx_VerDef;
```

Figure 10-1 Version Definition Entries

vd_version

Version revision. This field shall be set to 1.

vd_flags

Version information flag bitmask.

vd_ndx

Version index numeric value referencing the SHT_GNU_versym section.

vd_cnt

Number of associated verdaux array entries.

vd_hash

Version name hash value (ELF hash function).

vd_aux

Offset in bytes to a corresponding entry in an array of Elfxx_Verdaux structures as defined in Figure 10-2

vd_next

Offset to the next verdef entry, in bytes.

```
typedef struct {
    Elfxx_Word    vda_name;
    Elfxx_Word    vda_next;
} Elfxx_Verdaux;
```

Figure 10-2 Version Definition Auxiliary Entries

vda_name

Offset to the version or dependency name string in the section header, in bytes.

vda_next

Offset to the next verdaux entry, in bytes.

10.7.4 Version Requirements

The special section `.gnu.version_r` which has a section type of SHT_GNU_verneed shall contain required symbol version definitions. The number of entries in this section shall be contained in the DT_VERNEEDNUM entry of the Dynamic Section `.dynamic`. The `sh_link` member of the section header (see figure 4-8 in System V ABI) shall point to the section that contains the strings referenced by this section.

The section shall contain an array of Elfxx_Verneed structures, as described in Figure 10-3, optionally followed by an array of Elfxx_Vernaux structures, as defined in Figure 10-4.

```
typedef struct {
    Elfxx_Half    vn_version;
    Elfxx_Half    vn_cnt;
    Elfxx_Word    vn_file;
    Elfxx_Word    vn_aux;
    Elfxx_Word    vn_next;
} Elfxx_Verneed;
```

Figure 10-3 Version Needed Entries

vn_version

Version of structure. This value is currently set to 1, and will be reset if the versioning implementation is incompatibly altered.

vn_cnt

Number of associated verneed array entries.

vn_file

Offset to the file name string in the section header, in bytes.

vn_aux

Offset to a corresponding entry in the vernaux array, in bytes.

vn_next

Offset to the next verneed entry, in bytes.

```
typedef struct {
    Elfxx_Word    vna_hash;
    Elfxx_Half    vna_flags;
    Elfxx_Half    vna_other;
    Elfxx_Word    vna_name;
    Elfxx_Word    vna_next;
} Elfxx_Vernaux;
```

Figure 10-4 Version Needed Auxiliary Entries

vna_hash

Dependency name hash value (ELF hash function).

vna_flags

Dependency information flag bitmask.

vna_other

Object file version identifier used in the .gnu.version symbol version array. Bit number 15 controls whether or not the object is hidden; if this bit is set, the object cannot be used and the static linker will ignore the symbol's presence in the object.

vna_name

Offset to the dependency name string in the section header, in bytes.

vna_next

Offset to the next vernaux entry, in bytes.

10.7.5 Startup Sequence

When loading a sharable object the system shall analyze version definition data from the loaded object to assure that it meets the version requirements of the calling object. This step is referred to as definition testing. The dynamic loader shall retrieve the entries in the caller's `Elfxx_Verneed` array and attempt to find matching definition information in the loaded `Elfxx_Verdef` table.

Each object and dependency shall be tested in turn. If a symbol definition is missing and the `vna_flags` bit for `VER_FLG_WEAK` is not set, the loader shall return an error and exit. If the `vna_flags` bit for `VER_FLG_WEAK` is set in the `Elfxx_Vernaux` entry, and the loader shall issue a warning and continue operation.

When the versions referenced by undefined symbols in the loaded object are found, version availability is certified. The test completes without error and the object shall be made available.

10.7.6 Symbol Resolution

When symbol versioning is used in an object, relocations extend definition testing beyond the simple match of symbol name strings: the version of the reference shall also equal the name of the definition.

The same index that is used in the symbol table can be referenced in the `SHT_GNU_verSYM` section, and the value of this index is then used to acquire name data. The corresponding requirement string is retrieved from the `Elfxx_Verneed` array, and likewise, the corresponding definition string from the `Elfxx_Verdef` table.

If the high order bit (bit number 15) of the version symbol is set, the object cannot be used and the static linker shall ignore the symbol's presence in the object.

When an object with a reference and an object with the definition are being linked, the following rules shall govern the result:

- The object with the reference and the object with the definitions both use versioning. All described matching is processed in this case. A fatal error shall be triggered when no matching definition can be found in the object whose name is the one referenced by the `vn_name` element in the `Elfxx_Verneed` entry.
- The object with the reference does not use versioning, while the object with the definitions does. In this instance, only the definitions with index numbers 1 and 2 will be used in the reference match, the same identified by the static linker as the base definition. In cases where the static linker was not used, such as in calls to `dlopen()`, a version that does not have the base definition index shall be acceptable if it is the only version for which the symbol is defined.
- The object with the reference uses versioning, but the object with the definitions specifies none. A matching symbol shall be accepted in this case. A fatal error shall be triggered if a corruption in the required symbols list obscures an outdated object file and causes a match on the object filename in the `Elfxx_Verneed` entry.
- Neither the object with the reference nor the object with the definitions use versioning. The behavior in this instance shall default to pre-existing symbol rules.

10.8 ABI note tag

Every executable shall contain a section named `.note.ABI-tag` of type `SHT_NOTE`. This section is structured as a note section as documented in the ELF spec. The section shall contain at least the following entry. The `name` field (`namesz/name`) contains the string "GNU". The `type` field shall be 1. The `descsz` field shall be at least 16, and the first 16 bytes of the `desc` field shall be as follows.

The first 32-bit word of the `desc` field shall be 0 (this signifies a Linux executable). The second, third, and fourth 32-bit words of the `desc` field contain the earliest compatible kernel version. For example, if the 3 words are 2, 2, and 5, this signifies a 2.2.5 kernel.

11 Dynamic Linking

11.1 Program Loading and Dynamic Linking

LSB-conforming implementations shall support the object file information and system actions that create running programs as specified in the System V ABI and System V ABI Update and as further required by this specification and the relevant architecture specific part of the LSB Core Specification.

Any shared object that is loaded shall contain sufficient DT_NEEDED records to satisfy the symbols on the shared library.

11.2 Program Header

In addition to the Segment Types defined in the System V ABI and System V ABI Update the following Segment Types shall also be supported.

Table 11-1 Linux Segment Types

Name	Value
PT_GNU_EH_FRAME	0x6474e550
PT_GNU_STACK	0x6474e551
PT_GNU_RELRO	0x6474e552

PT_GNU_EH_FRAME

The array element specifies the location and size of the exception handling information as defined by the `.eh_frame_hdr` section.

PT_GNU_STACK

The `p_flags` member specifies the permissions on the segment containing the stack and is used to indicate whether the stack should be executable. The absence of this header indicates that the stack will be executable.

PT_GNU_RELRO

the array element specifies the location and size of a segment which may be made read-only after relocations have been processed.

11.3 Dynamic Entries

11.3.1 Introduction

As described in System V ABI, if an object file participates in dynamic linking, its program header table shall have an element of type `PT_DYNAMIC`. This 'segment' contains the `.dynamic` section. A special symbol, `_DYNAMIC`, labels the section, which contains an array of the following structures.

```
typedef struct {
    Elf32_Sword    d_tag;
    union {
        Elf32_Word    d_val;
        Elf32_Addr    d_ptr;
    } d_un;
} Elf32_Dyn;
```

```

extern Elf32_Dyn      _DYNAMIC[];

typedef struct {
    Elf64_Sxword      d_tag;
    union {
        Elf64_Xword    d_val;
        Elf64_Addr     d_ptr;
    } d_un;
} Elf64_Dyn;

extern Elf64_Dyn      _DYNAMIC[];

```

Figure 11-1 Dynamic Structure

For each object with this type, *d_tag* controls the interpretation of *d_un*.

11.3.2 Dynamic Entries

11.3.2.1 ELF Dynamic Entries

The following dynamic entries are defined in the System V ABI and System V ABI Update.

DT_BIND_NOW

Process relocations of object

DT_DEBUG

For debugging; unspecified

DT_FINI

Address of termination function

DT_FINI_ARRAY

The address of an array of pointers to termination functions.

DT_FINI_ARRAYSZ

Size in bytes of DT_FINI_ARRAY

DT_FLAGS

Flag values specific to the object being loaded

DT_HASH

Address of symbol hash table

DT_HIPROC

End of processor-specific

DT_INIT

Address of init function

DT_INIT_ARRAY

The address of an array of pointers to initialization functions.

DT_INIT_ARRAYSZ	Size in bytes of DT_INIT_ARRAY
DT_JMPREL	Address of PLT relocs
DT_LOPROC	Start of processor-specific
DT_NEEDED	Name of needed library
DT_NULL	Marks end of dynamic section
DT_PLTREL	Type of reloc in PLT
DT_PLTRELSZ	Size in bytes of PLT relocs
DT_PREINIT_ARRAY	Array with addresses of preinit functions
DT_PREINIT_ARRAYSZ	Size in bytes of DT_PREINIT_ARRAY
DT_REL	Address of Rel relocs
DT_RELA	Address of Rela relocs
DT_RELAENT	Size of one Rela reloc
DT_RELASZ	Total size of Rela relocs
DT_RELENT	Size of one Rel reloc
DT_RELSZ	Total size of Rel relocs
DT_RPATH	Library search path

DT_RUNPATH	null-terminated library search path string
DT_SONAME	Name of shared object
DT_STRSZ	Size of string table
DT_STRTAB	Address of string table
DT_SYMBOLIC	Start symbol search here
DT_SYMENT	Size of one symbol table entry
DT_SYMTAB	Address of symbol table
DT_TEXTREL	Reloc might modify .text

11.3.2.2 Additional Dynamic Entries

An LSB conforming object may also use the following additional Dynamic Entry types.

DT_ADDRRNGHI	Values from DT_ADDRRNGLO through DT_ADDRRNGHI are reserved for definition by an architecture specific part.
DT_ADDRRNGLO	Values from DT_ADDRRNGLO through DT_ADDRRNGHI are reserved for definition by an architecture specific part.
DT_AUXILIARY	Shared object to load before self
DT_FILTER	Shared object to get values from
DT_HIOS	Values from DT_LOOS through DT_HIOS are reserved for definition by specific operating systems.

DT_LOOS

Values from DT_LOOS through DT_HIOS are reserved for definition by specific operating systems.

DT_NUM

Number of dynamic entry tags defined (excepting reserved ranges).

DT_POSFLAG_1

Flags for DT_* entries, effecting the following DT_* entry

DT_RELCOUNT

All Elf32_Rel R_*_RELATIVE relocations have been placed into a single block and this entry specifies the number of entries in that block. This permits ld.so.1 to streamline the processing of RELATIVE relocations.

DT_SYMINENT

Entry size of syminfo

DT_SYMINFO

Address of the Syminfo table.

DT_SYMINSZ

Size of syminfo table (in bytes)

DT_VALRNGHI

Entries which fall between DT_VALRNGHI & DT_VALRNGLO use the Dyn.d_un.d_val field of the Elf*_Dyn structure.

DT_VALRNGLO

Entries which fall between DT_VALRNGHI & DT_VALRNGLO use the Dyn.d_un.d_val field of the Elf*_Dyn structure.

DT_VERDEF

Address of version definition table

DT_VERDEFNUM

Number of version definitions

DT_VERNEED

Address of table with needed versions

DT_VERNEEDNUM

Number of needed versions

DT_VERSYM

Address of the table provided by the .gnu.version section.

12 C++ Class Representations

12.1 C++ Data Representation

Support for the C++ language shall be as specified in Itanium™ C++ ABI.

Note: This document, although containing a few architecture specific matters, is written as a generic specification, to be usable by C++ implementations on a variety of architectures.

This section provides additional information to supplement Itanium™ C++ ABI. Many of the definitions in that document are made in terms of C++. This section provides additional explanations using C terms to avoid self-referential problems.

12.1.1 Class Representation

An object file generated by the compilation process for a C++ program shall contain several closely related internal objects, or Class Components, to represent each C++ Class. Such objects are not a visible part of the source code. Table 12-1 describes these Class Components at a high level.

Table 12-1 Class Components

Object	Contains
Class Data	All non-static Class members
Virtual Table	Information needed to dispatch virtual functions, access virtual base class subobjects and to access the RTTI information
RTTI	Run-Time Type Information used by the typeid and dynamic_cast operators, and exception handlers
Typeinfo Name	String representation of Class name
Construction Virtual Table	Information needed during construction and destruction of Classes with non-trivial inheritance relationships.
VTT	A table of virtual table pointers which holds the addresses of construction and non-construction virtual tables.

12.1.1.1 Virtual Table

Virtual tables are specified in Section 2.5.3 of Itanium™ C++ ABI.

Of the various categories of virtual table described in that specification, Category 1 (Leaf) is further described in Figure 12-1 and Category 2 (Non-virtual bases only) is further described in Figure 12-2. LSB conforming systems shall support these categories.

```
struct {
```

```

        ptrdiff_t      baseobject;
        const char     *typeinfo;
        fptr           virtfuncs[0];
};

```

Figure 12-1 Category 1 Virtual Table

```

struct {
    unsigned long    vcalloffset;
    ptrdiff_t        baseobject;
    const char       *typeinfo;
    fptr             virtfuncs[0];
};

```

Figure 12-2 Category 2 Virtual Table

This specification describes requirements for virtual tables of C++ classes using tables of the following form:

Table 12-2 Primary vtable for K (example)

Base Offset	0
Virtual Base Offset	0
RTTI	typeinfo for K
vfunc[0]:	K::~K()
vfunc[1]:	K::~K()
vfunc[2]:	K::m1(int*)
vfunc[3]:	X::m2()
vfunc[4]:	__cxa_pure_virtual()
vfunc[5]:	NULL or X::m4(int)

Each row starting from 'vfunc[i]:' refers to a vtable entry 'vfunc[i]' of a class K, which is an entry for a virtual function A::m, where A is a base class of the class K as described in the Itanium™ C++ ABI. This specification requires implementations to interpret the vtable entry information in the following way:

1. A conforming implementation shall contain a vtable of the class K in the specified shared library;
2. The corresponding entry of this vtable 'vfunc[i]' shall be an entry for the virtual function A::m;
3. If the second column of the row contains __cxa_pure_virtual() the corresponding vtable entry of a LSB-conforming implementation shall contain __cxa_pure_virtual() or 'Y::m', where Y is the class K, the class A or a base class of the class K derived from the class A.

Note: In this case virtual function A::m in class K is considered to be specified as pure virtual by this specification.

4. If the second column of the row contains 'X::m' the corresponding vtable entry of a LSB-conforming implementation shall contain 'Y::m', where Y is

the class K, the class X or a base class of the class K derived from the class X.

5. If the second column of the row contains 'NULL or X::m' the corresponding vtable entry of a LSB-conforming implementation shall contain NULL or 'Y::m', where Y is the class K, the class X or a base class of the class K derived from the class X.

Note: In this case virtual function A::m in class K is considered to be specified as inline by this specification.

An application may use any non-pure virtual function specified in this specification, and can expect the specified behavior irrespective of which particular method implements this functionality. An application may not use inline virtual functions at the binary level since its vtable entry may be NULL.

12.1.1.2 Run-Time Type Information

Each type used in a C++ program has a data structure associated with it that provide information about the type which is used at runtime. This Run Time Type Information (RTTI) is defined in section 2.9.5 in Itanium™ C++ ABI. Additional details about the layout of this data is provided here.

```
struct {
    void      *basevtable;
    char      *name;
};
```

Figure 12-3 Run-Time Type Information Prefix

```
struct {
    void      *basevtable;
    char      *name;
    void      *basetypeinfo[0];
};
```

Figure 12-4 Run-Time Type Information For Classes with no base class

```
struct {
    void      *basevtable;
    char      *name;
    void      *basetype;
    void      *basetypeinfo[0];
};
```

Figure 12-5 Run-Time Type Information for Classes with a single base class

```
struct base_type_info {
    char      *base_type;
    unsigned long offset_flags;
};

struct {
    void      *basevtable;
    char      *name;
    unsigned int  flags;
    unsigned int  base_count;
    struct base_type_info base_info[0];
};
```

Figure 12-6 Run-Time Type Information for classes with multiple inheritance

```

struct {
    void    *basevtable;
    char    *name;
    unsigned int  flags;
    void    *pointee;
    void    *context;
    void    *basetypeinfo[0];
};

```

Figure 12-8 Run-Time Type Information for pointer to member types

13 Symbol Mapping

This chapter defines how names are mapped from the source symbol to the object symbol.

13.1 Symbol Mapping

Symbols in a source program are translated by the compilation system into symbols that exist in the object file. The rules for this translation are defined here.

13.1.1 C++ Language

External symbol names in a C++ object file shall be encoded according to the "name mangling" rules described in the Itanium™ C++ ABI.

III Base Libraries

14 Base Libraries

14.1 Introduction

An LSB-conforming implementation shall support the following base libraries which provide interfaces for accessing the operating system, processor and other hardware in the system.

- libc
- libm
- libgcc_s
- libdl
- librt
- libcrypt
- libpam

There are three main parts to the definition of each of these libraries.

The "Interfaces" section defines the required library name and version, and the required public symbols (interfaces and global data), as well as symbol versions, if any.

The "Interface Definitions" section provides complete or partial definitions of certain interfaces where either this specification is the source specification, or where there are variations from the source specification. If an interface definition requires one or more header files, one of those headers shall include the function prototype for the interface.

For source definitions of interfaces which include a reference to a header file, the contents of such header files form a part of the specification. The "Data Definitions" section provides the binary-level details for the header files from the source specifications, such as values for macros and enumerated types, as well as structure layouts, sizes and padding, etc. These data definitions, although presented in the form of header files for convenience, should not be taken as representing complete header files, as they are a supplement to the source specifications. Application developers should follow the guidelines of the source specifications when determining which header files need to be included to completely resolve all references.

Note: While the Data Definitions supplement the source specifications, this specification itself does not require conforming implementations to supply any header files.

14.2 Program Interpreter

The Program Interpreter is specified in the appropriate architecture specific part of the LSB Core Specification.

14.3 Interfaces for libc

Table 14-1 defines the library name and shared object name for the libc library

Table 14-1 libc Definition

Library:	libc
SONAME:	See architecture specific part.

The behavior of the interfaces in this library is specified by the following specifications:

[LFS] Large File Support

[LSB] This Specification

[RPC + XDR] RFC 5531/4506 RPC & XDR

[SUSv2] SUSv2

[SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

[SVID.4] SVID Issue 4

14.3.1 RPC

14.3.1.1 Interfaces for RPC

An LSB conforming implementation shall provide the generic functions for RPC specified in Table 14-2, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-2 libc - RPC Function Interfaces

authnone_create [SVID.4]	callrpc [RPC + XDR]	clnt_create [SVID.4]	clnt_pcreateerror [SVID.4]
clnt_permno [SVID.4]	clnt_perror [SVID.4]	clnt_screateerror [SVID.4]	clnt_spermno [SVID.4]
clnt_sperror [SVID.4]	clntraw_create [RPC + XDR]	clnttcp_create [RPC + XDR]	clntudp_bufcreate [RPC + XDR]
clntudp_create [RPC + XDR]	key_decryptsession [SVID.4]	pmap_getport [LSB]	pmap_set [LSB]

xdrrec_eof [SVID.4]	xdrrec_skiprecord [RPC + XDR]	xdrstdio_create [LSB]	

An LSB conforming implementation shall provide the generic deprecated functions for RPC specified in Table 14-3, with the full mandatory functionality as described in the referenced underlying specification.

Note: These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.

Table 14-3 libc - RPC Deprecated Function Interfaces

key_decryptsession [SVID.4]			
-----------------------------	--	--	--

14.3.2 Epoll

14.3.2.1 Interfaces for Epoll

An LSB conforming implementation shall provide the generic functions for Epoll specified in Table 14-4, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-4 libc - Epoll Function Interfaces

epoll_create(GLIBC_2.3.2) [LSB]	epoll_ctl(GLIBC_2.3.2) [LSB]	epoll_wait(GLIBC_2.3.2) [LSB]

newlocale(GLIBC_2.3) [SUSv4]	ngettext [LSB]	nl_langinfo [SUSv4]	setlocale [SUSv4]
textdomain [LSB]	uselocale(GLIBC_2.3) [SUSv4]		

An LSB conforming implementation shall provide the generic data interfaces for Localization Functions specified in Table 14-14, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-14 libc - Localization Functions Data Interfaces

_nl_msg_cat_cntr [LSB]			
------------------------	--	--	--

14.3.7 Posix Spawn Option

14.3.7.1 Interfaces for Posix Spawn Option

An LSB conforming implementation shall provide the generic functions for Posix Spawn Option specified in Table 14-15, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-15 libc - Posix Spawn Option Function Interfaces

posix_spawn [SUSv4]	posix_spawn_file_actions_addclose [SUSv4]	posix_spawn_file_actions_adddup2 [SUSv4]	posix_spawn_file_actions_addopen [SUSv4]
posix_spawn_file_actions_destroy [SUSv4]	posix_spawn_file_actions_init [SUSv4]	posix_spawnattr_destroy [SUSv4]	posix_spawnattr_getflags [SUSv4]

posix_spawnattr _getpgroup [SUSv4]	posix_spawnattr _getschedparam [SUSv4]	posix_spawnattr _getschedpolicy [SUSv4]	posix_spawnattr _getsigdefault [SUSv4]
posix_spawnattr _getsigmask [SUSv4]	posix_spawnattr _init [SUSv4]	posix_spawnattr _setflags [SUSv4]	posix_spawnattr _setpgroup [SUSv4]
posix_spawnattr _setschedparam [SUSv4]	posix_spawnattr _setschedpolicy [SUSv4]	posix_spawnattr _setsigdefault [SUSv4]	posix_spawnattr _setsigmask [SUSv4]
posix_spawn [SUSv4]			

14.3.8 Posix Advisory Option

14.3.8.1 Interfaces for Posix Advisory Option

An LSB conforming implementation shall provide the generic functions for Posix Advisory Option specified in Table 14-16, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-16 libc - Posix Advisory Option Function Interfaces

posix_fadvise [SUSv4]	posix_fallocate [SUSv4]	posix_madvise [SUSv4]	posix_memalign [SUSv4]
--------------------------	----------------------------	--------------------------	---------------------------

14.3.9 Socket Interface

14.3.9.1 Interfaces for Socket Interface

An LSB conforming implementation shall provide the generic functions for Socket Interface specified in Table 14-17, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-17 libc - Socket Interface Function Interfaces

__gethostname_c hk(GLIBC_2.4) [LSB]	__h_errno_locati on [LSB]	__recv_chk(GLIB C_2.4) [LSB]	__recvfrom_chk(GLIBC_2.4) [LSB]

-----------------	----------------------------------	-----------------	----------------------------------

14.3.15 Time Manipulation

14.3.15.1 Interfaces for Time Manipulation

An LSB conforming implementation shall provide the generic functions for Time Manipulation specified in Table 14-25, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-25 libc - Time Manipulation Function Interfaces

adjtime [LSB]	asctime [SUSv4]	asctime_r [SUSv4]	ctime [SUSv4]
ctime_r [SUSv4]	difftime [SUSv4]	gmtime [SUSv4]	gmtime_r [SUSv4]
localtime [SUSv4]	localtime_r [SUSv4]	mktime [SUSv4]	tzset [SUSv4]
ualarm [SUSv3]			

An LSB conforming implementation shall provide the generic data interfaces for Time Manipulation specified in Table 14-26, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-26 libc - Time Manipulation Data Interfaces

__daylight [LSB]	__timezone [LSB]	__tzname [LSB]	daylight [SUSv4]
timezone [SUSv4]	tzname [SUSv4]		

14.3.16 Terminal Interface Functions

14.3.16.1 Interfaces for Terminal Interface Functions

An LSB conforming implementation shall provide the generic functions for Terminal Interface Functions specified in Table 14-27, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-27 libc - Terminal Interface Functions Function Interfaces

cfgetispeed [SUSv4]	cfgetospeed [SUSv4]	cfmakeraw [LSB]	cfsetispeed [SUSv4]
cfsetospeed [SUSv4]	cfsetspeed [LSB]	tcdrain [SUSv4]	tcflow [SUSv4]
tcflush [SUSv4]	tcgetattr [SUSv4]	tcgetpgrp [SUSv4]	tcgetsid [SUSv4]
tcsendbreak [SUSv4]	tcsetattr [SUSv4]	tcsetpgrp [SUSv4]	

14.3.17 System Database Interface

14.3.17.1 Interfaces for System Database Interface

An LSB conforming implementation shall provide the generic functions for System Database Interface specified in Table 14-28, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-28 libc - System Database Interface Function Interfaces

endgrent [SUSv4]	endprotoent [SUSv4]	endpwent [SUSv4]	endservent [SUSv4]
endutent [LSB]	endutxent [SUSv4]	getgrent [SUSv4]	getgrent_r [LSB]
getgrgid [SUSv4]	getgrgid_r [SUSv4]	getgrnam [SUSv4]	getgrnam_r [SUSv4]
getgrouplist [LSB]	gethostbyaddr [SUSv3]	gethostbyaddr_r [LSB]	gethostbyname [SUSv3]

setutent [LSB]	setutxent [SUSv4]	utmpname [LSB]	

An LSB conforming implementation shall provide the generic deprecated functions for System Database Interface specified in Table 14-29, with the full mandatory functionality as described in the referenced underlying specification.

Note: These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.

Table 14-29 libc - System Database Interface Deprecated Function Interfaces

gethostbyaddr [SUSv3]	gethostbyaddr_r [LSB]	gethostbyname [SUSv3]	gethostbyname2 [LSB]
gethostbyname2 _r [LSB]	gethostbyname_r [LSB]		

14.3.18 Language Support

14.3.18.1 Interfaces for Language Support

An LSB conforming implementation shall provide the generic functions for Language Support specified in Table 14-30, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-30 libc - Language Support Function Interfaces

__libc_start_mai n [LSB]	__register_atfork (GLIBC_2.3.2) [LSB]		
-----------------------------	---	--	--

14.3.19 Large File Support

14.3.19.1 Interfaces for Large File Support

An LSB conforming implementation shall provide the generic functions for Large File Support specified in Table 14-31, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-31 libc - Large File Support Function Interfaces

__fxstat64 [LSB]	__fxstat64(GLI BC_2.4) [LSB]	__lxstat64 [LSB]	__xstat64 [LSB]

14.3.22 GNU Extensions for libc

14.3.22.1 Interfaces for GNU Extensions for libc

An LSB conforming implementation shall provide the generic functions for GNU Extensions for libc specified in Table 14-37, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-37 libc - GNU Extensions for libc Function Interfaces

gnu_get_libc_release [LSB]	gnu_get_libc_version [LSB]		
----------------------------	----------------------------	--	--

14.4 Data Definitions for libc

This section defines global identifiers and their values that are associated with interfaces contained in libc. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

14.4.1 argz.h

```

typedef int error_t;
extern error_t argz_add(char **argz, size_t * argz_len, const char
*str);
extern error_t argz_add_sep(char **argz, size_t * argz_len,
const char *str, int sep);
extern error_t argz_append(char **argz, size_t * argz_len, const
char *buf,
size_t buf_len);
extern size_t argz_count(const char *argz, size_t * argz_len);
extern error_t argz_create(char *const argv[], char **argz,
size_t * argz_len);
extern error_t argz_create_sep(const char *str, int sep, char
**argz,
size_t * argz_len);
extern void argz_delete(char **argz, size_t * argz_len, char
*entry);
extern void argz_extract(const char *argz, size_t argz_len, char
**argv);
extern error_t argz_insert(char **argz, size_t * argz_len,
char *before, const char *entry);
extern char argz_next(const char *argz, size_t argz_len,
const char *entry);
extern error_t argz_replace(char **argz, size_t * argz_len,
const char *str, const char *with,
unsigned int *replace_count);
extern void argz_stringify(char *argz, size_t argz_len, int sep);

```

14.4.2 arpa/inet.h

```

```

14.5 Interface Definitions for libc

The interfaces defined on the following pages are included in libc and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 14.3 shall behave as described in the referenced base document.

_IO_feof

Name

`_IO_feof` — alias for `feof`

Synopsis

```
int _IO_feof(_IO_FILE * __fp);
```

Description

`_IO_feof()` tests the end-of-file indicator for the stream pointed to by `__fp`, returning a non-zero value if it is set.

`_IO_feof()` is not in the source standard; it is only in the binary standard.

_IO_getc

Name

`_IO_getc` — alias for `getc`

Synopsis

```
int _IO_getc(_IO_FILE * __fp);
```

Description

`_IO_getc()` reads the next character from `__fp` and returns it as an unsigned char cast to an int, or EOF on end-of-file or error.

`_IO_getc()` is not in the source standard; it is only in the binary standard.

_IO_putc

Name

`_IO_putc` — alias for `putc`

Synopsis

```
int _IO_putc(int __c, _IO_FILE * __fp);
```

Description

`_IO_putc()` writes the character `__c`, cast to an unsigned char, to `__fp`.

`_IO_putc()` is not in the source standard; it is only in the binary standard.

_IO_puts

Name

`_IO_puts` — alias for `puts`

Synopsis

```
int _IO_puts(const char * __s);
```

Description

`_IO_puts()` writes the string `__s` and a trailing newline to `stdout`.

`_IO_puts()` is not in the source standard; it is only in the binary standard.

__assert_fail

Name

`__assert_fail` — abort the program after false assertion

Synopsis

```
void __assert_fail(const char * assertion, const char * file, unsigned
int line, const char * function);
```

Description

The `__assert_fail()` function is used to implement the `assert()` interface of POSIX 1003.1-2008 (ISO/IEC 9945-2009). The `__assert_fail()` function shall print the given *file* filename, *line* line number, *function* function name and a message on the standard error stream in an unspecified format, and abort program execution via the `abort()` function. For example:

a.c:10: foobar: Assertion a == b failed.

If *function* is `NULL`, `__assert_fail()` shall omit information about the function. *assertion*, *file*, and *line* shall be non-`NULL`.

The `__assert_fail()` function is not in the source standard; it is only in the binary standard. The `assert()` interface is not in the binary standard; it is only in the source standard. The `assert()` may be implemented as a macro.

__chk_fail

Name

`__chk_fail` — terminate a function in case of buffer overflow

Synopsis

```
void __chk_fail(void);
```

Description

The interface `__chk_fail()` shall abort the function that called it with a message that a buffer overflow has been detected. The program that called the function shall then exit.

The `__chk_fail()` function is not in the source standard; it is only in the binary standard.

Application Usage (informative)

The interface `__chk_fail()` does not check for a buffer overflow itself. It merely reports one when invoked.

__confstr_chk

Name

`__confstr_chk` — get configuration dependent string variables, with buffer overflow checking

Synopsis

```
#include <unistd.h>
size_t __confstr_chk(int name, char * buf, size_t len, size_t buflen);
```

Description

The interface `__confstr_chk()` shall function in the same way as the interface `confstr()`, except that `__confstr_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The `__confstr_chk()` function is not in the source standard; it is only in the binary standard.

__ctype_b_loc

Name

`__ctype_b_loc` — accessor function for `__ctype_b` array for ctype functions

Synopsis

```
#include <ctype.h>
const unsigned short * * __ctype_b_loc (void);
```

Description

The `__ctype_b_loc()` function shall return a pointer into an array of characters in the current locale that contains characteristics for each character in the current character set. The array shall contain a total of 384 characters, and can be indexed with any signed or unsigned char (i.e. with an index value between -128 and 255). If the application is multithreaded, the array shall be local to the current thread.

This interface is not in the source standard; it is only in the binary standard.

Return Value

The `__ctype_b_loc()` function shall return a pointer to the array of characters to be used for the `ctype()` family of functions (see `<ctype.h>`).

__ctype_get_mb_cur_max**Name**

`__ctype_get_mb_cur_max` — maximum length of a multibyte character in the current locale

Synopsis

```
size_t __ctype_get_mb_cur_max(void);
```

Description

`__ctype_get_mb_cur_max()` returns the maximum length of a multibyte character in the current locale.

`__ctype_get_mb_cur_max()` is not in the source standard; it is only in the binary standard.

__ctype_tolower_loc**Name**

`__ctype_tolower_loc` — accessor function for `__ctype_b_tolower` array for `ctype_tolower()` function

Synopsis

```
#include <ctype.h>
int32_t * * __ctype_tolower_loc(void);
```

Description

The `__ctype_tolower_loc()` function shall return a pointer into an array of characters in the current locale that contains lower case equivalents for each character in the current character set. The array shall contain a total of 384 characters, and can be indexed with any signed or unsigned char (i.e. with an index value between -128 and 255). If the application is multithreaded, the array shall be local to the current thread.

This interface is not in the source standard; it is only in the binary standard.

Return Value

The `__ctype_tolower_loc()` function shall return a pointer to the array of characters to be used for the `ctype()` family of functions (see `<ctype.h>`).

__ctype_toupper_loc**Name**

`__ctype_toupper_loc` — accessor function for `__ctype_b_toupper()` array for `ctype_toupper()` function

Synopsis

```
#include <ctype.h>
int32_t * * __ctype_toupper_loc(void);
```

Description

The `__ctype_toupper_loc()` function shall return a pointer into an array of characters in the current locale that contains upper case equivalents for each character in the current character set. The array shall contain a total of 384 characters, and can be indexed with any signed or unsigned char (i.e. with an index value between -128 and 255). If the application is multithreaded, the array shall be local to the current thread.

This interface is not in the source standard; it is only in the binary standard.

Return Value

The `__ctype_toupper_loc()` function shall return a pointer to the array of characters to be used for the `ctype()` family of functions (see `<ctype.h>`).

__cxa_atexit**Name**

`__cxa_atexit` — register a function to be called by `exit` or when a shared library is unloaded

Synopsis

```
int __cxa_atexit(void (*func) (void *), void * arg, void * dso_handle);
```

Description

As described in the Itanium™ C++ ABI, `__cxa_atexit()` registers a destructor function to be called by `exit()` or when a shared library is unloaded. When a shared library is unloaded, any destructor function associated with that shared library, identified by `dso_handle`, shall be called with the single argument `arg`, and then that function shall be removed, or marked as complete, from the list of functions to run at `exit()`. On a call to `exit()`, any remaining functions registered shall be called with the single argument `arg`. Destructor functions shall always be called in the reverse order to their registration (i.e. the most recently registered function shall be called first),

The `__cxa_atexit()` function is used to implement `atexit()`, as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009). Calling `atexit(func)` from the statically linked part of an application shall be equivalent to `__cxa_atexit(func, NULL, NULL)`.

`__cxa_atexit()` is not in the source standard; it is only in the binary standard.

Note: `atexit()` is not in the binary standard; it is only in the source standard.

__cxa_finalize

Name

`__cxa_finalize` — call destructors of global (or local static) C++ objects and exit functions registered with `atexit`

Synopsis

```
void __cxa_finalize(void * d);
```

Description

As described in the Itanium® C++ ABI, the C runtime library shall maintain a list of termination function entries containing the following information:

- A pointer to a termination function.
- An operand to be passed to the function.
- A handle identifying the home shared library of the entry.

The list is populated by entries of two kinds:

- Destructors of global (or local static) C++ objects that require destruction on exit.
- Functions registered by the user with `atexit()`.

In the former case an entry consists of a pointer to the destructor, a pointer to the corresponding object and a handle for the home shared library of the object. In the latter case the pointer to the function is the pointer passed to `atexit()`, while the other pointers are `NULL`.

When `__cxa_finalize(d)` is called, it shall walk the termination function list, calling each in turn if `d` matches the handle of the termination function entry. If `d` is `NULL`, it shall call all the termination functions. Multiple calls to `__cxa_finalize` shall not result in calling termination function entries multiple times; the implementation may either remove entries or mark them finished. The termination functions shall always be called in the reverse order of their registration (i.e. the most recently registered function shall be called first).

An application shall not call `__cxa_finalize()` directly. The implementation shall arrange for `__cxa_finalize()` to be called during early shared library unload (e.g. `dlclose()`) with a handle to the shared library. When the main program calls `exit`, the implementation shall cause any remaining `__cxa_atexit`-registered functions to be called, either by calling `__cxa_finalize(NULL)`, or by walking the registration list itself.

`__cxa_finalize()` is not in the source standard; it is only in the binary standard.

__daylight**Name**

`__daylight` — external daylight savings time flag

Synopsis

```
int __daylight;
```

Description

The external variable `__daylight` shall implement the daylight savings time flag daylight as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). `__daylight` has the same specification as daylight.

__environ**Name**

`__environ` — alias for environ - user environment

Synopsis

```
extern char **__environ;
```

Description

The external variable `__environ` shall implement the environment variable environ as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). `__environ` has the same specification as environ.

__errno_location**Name**

`__errno_location` — address of errno variable

Synopsis

```
int * __errno_location(void);
```

Description

The `__errno_location()` function shall return the address of the `errno` variable for the current thread.

`__errno_location()` is not in the source standard; it is only in the binary standard.

__fgets_chk**Name**

`__fgets_chk` — string input, with buffer overflow checking

Synopsis

```
#include <stdio.h>
char * __fgets_chk(char * s, size_t size, int strsize, FILE * stream);
```

Description

The interface `__fgets_chk()` shall function in the same way as the interface `fgets()`, except that `__fgets_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The `__fgets_chk()` function is not in the source standard; it is only in the binary standard.

__fgets_unlocked_chk**Name**

`__fgets_unlocked_chk` — non-locking string input, with buffer overflow checking

Synopsis

```
#include <stdio.h>
char * __fgets_unlocked_chk(char * s, size_t size, int strsize, FILE *
stream);
```

Description

The interface `__fgets_unlocked_chk()` shall function in the same way as the interface `fgets_unlocked()`, except that `__fgets_unlocked_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The `__fgets_unlocked_chk()` function is not in the source standard; it is only in the binary standard.

__fgetws_chk

Name

`__fgetws_chk` — read a wide-character string from a FILE stream, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __fgetws_chk(wchar_t * ws, size_t size, int strsize, FILE *
stream);
```

Description

The interface `__fgetws_chk()` shall function in the same way as the interface `fgetws()`, except that `__fgetws_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The `__fgetws_chk()` function is not in the source standard; it is only in the binary standard.

__fgetws_unlocked_chk

Name

`__fgetws_unlocked_chk` — read a wide-character string from a FILE stream in a non-locking manner, with stack checking

Synopsis

```
#include <wchar.h>
wchar_t * __fgetws_unlocked_chk(wchar_t * ws, size_t strsize, int n,
FILE * stream);
```

Description

The interface `__fgetws_unlocked_chk()` shall function in the same way as the interface `fgetws_unlocked()`, except that `__fgetws_unlocked_chk()` shall check for stack overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *strsize* specifies the size of the object pointed to by *stream*.

The `__fgetws_unlocked_chk()` function is not in the source standard; it is only in the binary standard.

__fpending

Name

__fpending — returns in bytes the amount of output pending on a stream

Synopsis

```
size_t __fpending(FILE * stream);
```

Description

__fpending() returns the amount of output in bytes pending on a stream.

__fpending() is not in the source standard; it is only in the binary standard.

__fprintf_chk

Name

__fprintf_chk — convert formatted output, with stack checking

Synopsis

```
#include <stdio.h>
int __fprintf_chk(FILE * stream, int flag, const char * format);
```

Description

The interface __fprintf_chk() shall function in the same way as the interface fprintf(), except that __fprintf_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The __fprintf_chk() function is not in the source standard; it is only in the binary standard.

__fwprintf_chk

Name

`__fwprintf_chk` — convert formatted wide-character output, with stack checking

Synopsis

```
#include <wchar.h>
int __fwprintf_chk(FILE * stream, int flag, const wchar_t * format);
```

Description

The interface `__fwprintf_chk()` shall function in the same way as the interface `fwprintf()`, except that `__fwprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__fwprintf_chk()` function is not in the source standard; it is only in the binary standard.

__fxstatat

Name

`__fxstatat` — get file status relative to directory file descriptor

Synopsis

```
#include <fcntl.h>
#include <sys/stat.h>
int __fxstatat(int ver, int dirfd, const char * path, struct stat *
stat_buf, int flags);
```

Description

The `__fxstatat()` function shall implement the `fstatat()` function. The behavior of `__fxstatat()` for values of *ver* other than `_STAT_VER` is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of `_STAT_VER`.

`__fxstatat(_STAT_VER, dirfd, stat_buf, flags)` shall behave as `fstatat(dirfd, stat_buf, flags)` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__fxstatat()` is not in the source standard; it is only in the binary standard.

Note: The `fstatat()` function is not in the binary standard; it is only in the source standard.

__fxstatat64, fstatat64

Name

__fxstatat64, fstatat64 — get file status relative to a directory file descriptor (Large File Support)

Synopsis

```
#include <fcntl.h>
#include <sys/stat.h>
int __fxstatat64(int ver, int dirfd, const char * path, struct stat64
* stat_buf, int flags);
int fstatat64(int dirfd, const char * file, struct stat64 * buf, int
flag);
```

Description

fstatat64() is a large-file version of the fstatat() function as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It differs from fstatat() only in that the *buf* parameter refers to a large-file version of the stat structure.

The __fxstatat64() function shall implement the fstatat64() function. The behavior of __fxstatat64() for values of *ver* other than _STAT_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of _STAT_VER.

__fxstatat64(_STAT_VER, dirfd, stat_buf, flags) shall behave as fstatat64(dirfd, stat_buf, flags)

__fxstatat64() is not in the source standard; it is only in the binary standard.

Note: The fstatat64() function is not in the binary standard; it is only in the source standard.

__getcwd_chk

Name

__getcwd_chk — get current working directory, with buffer overflow checking

Synopsis

```
#include <unistd.h>
char * __getcwd_chk(char * buf, size_t len, size_t buflen);
```

Description

The interface __getcwd_chk() shall function in the same way as the interface getcwd(), except that __getcwd_chk() shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The __getcwd_chk() function is not in the source standard; it is only in the binary standard.

__getgroups_chk

Name

`__getgroups_chk` — get list of supplementary group IDs, with buffer overflow checking

Synopsis

```
#include <unistd.h>
int __getgroups_chk(int size, gid_t * list, size_t listlen);
```

Description

The interface `__getgroups_chk()` shall function in the same way as the interface `getgroups()`, except that `__getgroups_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *listlen* specifies the size in bytes of the object *list*.

The `__getgroups_chk()` function is not in the source standard; it is only in the binary standard.

__gethostname_chk

Name

`__gethostname_chk` — get host name, with buffer overflow checking

Synopsis

```
#include <unistd.h>
int __gethostname_chk(char * buf, size_t buflen, size_t maxlen);
```

Description

The interface `__gethostname_chk()` shall function in the same way as the interface `gethostname()`, except that `__gethostname_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *buflen* exceeds *maxlen*, the function shall abort, and the program calling it shall exit.

The `__gethostname_chk()` function is not in the source standard; it is only in the binary standard.

__getlogin_r_chk

Name

`__getlogin_r_chk` — get user name, with buffer overflow checking (reentrant)

Synopsis

```
#include <unistd.h>
int __getlogin_r_chk(char * buf, size_t buflen, size_t maxlen);
```

Description

The interface `__getlogin_r_chk()` shall function in the same way as the interface `getlogin_r()`, except that `__getlogin_r_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *buflen* exceeds *maxlen*, the function shall abort, and the program calling it shall exit.

The `__getlogin_r_chk()` function is not in the source standard; it is only in the binary standard.

__getpagesize

Name

`__getpagesize` — alias for `getpagesize` - get current page size

Synopsis

```
int __getpagesize(void);
```

Description

`__getpagesize()` is an alias for `getpagesize()` - get current page size.

`__getpagesize()` has the same specification as `getpagesize()`.

`__getpagesize()` is not in the source standard; it is only in the binary standard.

__getpgid

Name

`__getpgid` — get the process group id

Synopsis

```
pid_t __getpgid(pid_t pid);
```

Description

`__getpgid()` has the same specification as `getpgid()`.

`__getpgid()` is not in the source standard; it is only in the binary standard.

__h_errno_location**Name**

`__h_errno_location` — address of `h_errno` variable

Synopsis

```
int * __h_errno_location(void);
```

Description

`__h_errno_location()` returns the address of the `h_errno` variable, where `h_errno` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__h_errno_location()` is not in the source standard; it is only in the binary standard. Note that `h_errno` itself is only in the source standard; it is not in the binary standard.

__isinf**Name**

`__isinf` — test for infinity

Synopsis

```
int __isinf(double arg);
```

Description

`__isinf()` has the same specification as `isinf()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__isinf()` is known to be double.

`__isinf()` is not in the source standard; it is only in the binary standard.

__isinff**Name**

`__isinff` — test for infinity

Synopsis

```
int __isinff(float arg);
```

Description

`__isinff()` has the same specification as `isinf()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009) except that the argument type for `__isinff()` is known to be float.

`__isinff()` is not in the source standard; it is only in the binary standard.

__isinfl**Name**

`__isinfl` — test for infinity

Synopsis

```
int __isinfl(long double arg);
```

Description

`__isinfl()` has the same specification as `isinf()` in the POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__isinfl()` is known to be long double.

`__isinfl()` is not in the source standard; it is only in the binary standard.

__isnan**Name**

`__isnan` — test for infinity

Synopsis

```
int __isnan(double arg);
```

Description

`__isnan()` has the same specification as `isnan()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__isnan()` is known to be double.

`__isnan()` is not in the source standard; it is only in the binary standard.

__isnanf**Name**

`__isnanf` — test for infinity

Synopsis

```
int __isnanf(float arg);
```

Description

`__isnanf()` has the same specification as `isnan()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__isnanf()` is known to be float.

`__isnanf()` is not in the source standard; it is only in the binary standard.

__isnani**Name**

`__isnani` — test for infinity

Synopsis

```
int __isnani(long double arg);
```

Description

`__isnani()` has the same specification as `isnan()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__isnani()` is known to be long double.

`__isnani()` is not in the source standard; it is only in the binary standard.

__libc_current_sigrtmax**Name**

`__libc_current_sigrtmax` — return number of available real-time signal with lowest priority

Synopsis

```
int __libc_current_sigrtmax(void);
```

Description

`__libc_current_sigrtmax()` returns the number of an available real-time signal with the lowest priority.

`__libc_current_sigrtmax()` is not in the source standard; it is only in the binary standard.

__libc_current_sigrtmin**Name**

`__libc_current_sigrtmin` — return number of available real-time signal with highest priority

Synopsis

```
int __libc_current_sigrtmin(void);
```

Description

`__libc_current_sigrtmin()` returns the number of an available real-time signal with the highest priority.

`__libc_current_sigrtmin()` is not in the source standard; it is only in the binary standard.

__libc_start_main

Name

`__libc_start_main` — initialization routine

Synopsis

```
int __libc_start_main(int (*main) (int, char **, char **), int argc,
char ** ubp_av, void (*init) (void), void (*fini) (void), void
(*rtld_fini) (void), void (*stack_end));
```

Description

The `__libc_start_main()` function shall perform any necessary initialization of the execution environment, call the `main` function with appropriate arguments, and handle the return from `main()`. If the `main()` function returns, the return value shall be passed to the `exit()` function.

Note: While this specification is intended to be implementation independent, process and library initialization may include:

- performing any necessary security checks if the effective user ID is not the same as the real user ID.
- initialize the threading subsystem.
- registering the `rtld_fini` to release resources when this dynamic shared object exits (or is unloaded).
- registering the `fini` handler to run at program exit.
- calling the initializer function `(*init)()`.
- calling `main()` with appropriate arguments.
- calling `exit()` with the return value from `main()`.

This list is an example only.

`__libc_start_main()` is not in the source standard; it is only in the binary standard.

The section on Process Initialization in each of the architecture specific parts of the LSB Core Specification.

__mbsnrtowcs_chk

Name

`__mbsnrtowcs_chk` — convert a multibyte string to a wide-character string, with buffer overflow checking

Synopsis

```
#include <wchar.h>
size_t __mbsnrtowcs_chk(wchar_t * dest, const char * * src, size_t
nmc, size_t len, mbstate_t * ps, size_t destlen);
```

Description

The interface `__mbsnrtowcs_chk()` shall function in the same way as the interface `mbsnrtowcs()`, except that `__mbsnrtowcs_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The `__mbsnrtowcs_chk()` function is not in the source standard; it is only in the binary standard.

__mbsrtowcs_chk

Name

`__mbsrtowcs_chk` — convert a multibyte string to a wide-character string, with buffer overflow checking

Synopsis

```
#include <wchar.h>
size_t __mbsrtowcs_chk(wchar_t * dest, const char * * src, size_t len,
mbstate_t * ps, size_t destlen);
```

Description

The interface `__mbsrtowcs_chk()` shall function in the same way as the interface `mbsrtowcs()`, except that `__mbsrtowcs_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The `__mbsrtowcs_chk()` function is not in the source standard; it is only in the binary standard.

__mbstowcs_chk

Name

`__mbstowcs_chk` — convert a multibyte string to a wide-character string, with buffer overflow checking

Synopsis

```
#include <stdlib.h>
size_t __mbstowcs_chk(wchar_t * dest, const char * src, size_t len,
size_t destlen);
```

Description

The interface `__mbstowcs_chk()` shall function in the same way as the interface `mbstowcs()`, except that `__mbstowcs_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The `__mbstowcs_chk()` function is not in the source standard; it is only in the binary standard.

__memcpy_chk

Name

`__memcpy_chk` — copy memory area, with buffer overflow checking

Synopsis

```
#include <string.h>
void * __memcpy_chk(void * dest, const void * src, size_t len, size_t
destlen);
```

Description

The interface `__memcpy_chk()` shall function in the same way as the interface `memcpy()`, except that `__memcpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The `__memcpy_chk()` function is not in the source standard; it is only in the binary standard.

__memmove_chk

Name

`__memmove_chk` — copy memory area, with buffer overflow checking

Synopsis

```
#include <string.h>
void * __memmove_chk(void * dest, const void * src, size_t len, size_t
destlen);
```

Description

The interface `__memmove_chk()` shall function in the same way as the interface `memmove()`, except that `__memmove_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The `__memmove_chk()` function is not in the source standard; it is only in the binary standard.

__memcpy

Name

`__memcpy` — copy given number of bytes of source to destination

Synopsis

```
#include <string.h>
void * __memcpy(void * restrict dest, const void * restrict src,
size_t n);
```

Description

`__memcpy()` copies *n* bytes of *src* to *dest*, returning a pointer to the byte after the last written byte.

If copying takes place between objects that overlap, the behavior is undefined.

If either *dest* or *src* is a null pointer, the behavior is undefined.

If *n* is 0 and the other parameters are valid, the return value is *dest*.

`__memcpy()` is not in the source standard; it is only in the binary standard.

__memcpy_chk

Name

`__memcpy_chk` — copy memory area, with buffer overflow checking

Synopsis

```
#include <string.h>
void * __memcpy_chk(void * dest, const void * src, size_t len, size_t
destlen);
```

Description

The interface `__memcpy_chk()` shall function in the same way as the interface `memcpy()`, except that `__memcpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The `__memcpy_chk()` function is not in the source standard; it is only in the binary standard.

__memset_chk

Name

`__memset_chk` — fill memory with a constant byte, using buffer overflow checking

Synopsis

```
#include <string.h>
void * __memset_chk(void * dest, int c, size_t len, size_t destlen);
```

Description

The interface `__memset_chk()` shall function in the same way as the interface `memset()`, except that `__memset_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object *dest*. If *len* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The `__memset_chk()` function is not in the source standard; it is only in the binary standard.

__pread64_chk

Name

`__pread64_chk` — read from a file descriptor at a given offset, with buffer overflow checking

Synopsis

```
#include <unistd.h>
ssize_t __pread64_chk(int fd, void * buf, size_t nbytes, off64_t offset,
size_t buflen);
```

Description

The interface `__pread64_chk()` shall function in the same way as the interface `pread64()`, except that `__pread64_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *nbytes* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The `__pread64_chk()` function is not in the source standard; it is only in the binary standard.

__pread_chk

Name

`__pread_chk` — read from a file descriptor at a given offset, with buffer overflow checking

Synopsis

```
#include <unistd.h>
ssize_t __pread_chk(int fd, void * buf, size_t nbytes, off_t offset,
size_t buflen);
```

Description

The interface `__pread_chk()` shall function in the same way as the interface `pread()`, except that `__pread_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *nbytes* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The `__pread_chk()` function is not in the source standard; it is only in the binary standard.

__printf_chk

Name

`__printf_chk` — format and print data, with stack checking

Synopsis

```
#include <stdio.h>
int __printf_chk(int flag, const char * format);
```

Description

The interface `__printf_chk()` shall function in the same way as the interface `printf()`, except that `__printf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__printf_chk()` function is not in the source standard; it is only in the binary standard.

__rawmemchr

Name

`__rawmemchr` — scan memory

Synopsis

```
#include <string.h>
void * __rawmemchr(const void * s, int c);
```

Description

The `__rawmemchr()` function shall locate the first occurrence of *c* (converted to an unsigned char) in the object pointed to by *s*. If the byte does not occur in the object, then the behavior is undefined.

`__rawmemchr()` is a weak alias for `rawmemchr()`. It is similar to `memchr()`, but it has no length limit.

`__rawmemchr()` is not in the source standard; it is only in the binary standard.

Return Value

The `__rawmemchr()` function shall return a pointer to the located byte.

__read_chk

Name

`__read_chk` — read from a file descriptor, with buffer overflow checking

Synopsis

```
#include <unistd.h>
ssize_t __read_chk(int fd, void * buf, size_t nbytes, size_t buflen);
```

Description

The interface `__read_chk()` shall function in the same way as the interface `read()`, except that `__read_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *nbytes* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The `__read_chk()` function is not in the source standard; it is only in the binary standard.

__readlink_chk

Name

`__readlink_chk` — display value of a symbolic link, with buffer overflow checking

Synopsis

```
#include <unistd.h>
ssize_t __readlink_chk(const char * path, char * buf, size_t len,
size_t buflen);
```

Description

The interface `__readlink_chk()` shall function in the same way as the interface `readlink()`, except that `__readlink_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The `__readlink_chk()` function is not in the source standard; it is only in the binary standard.

__realpath_chk

Name

`__realpath_chk` — return the canonicalized absolute pathname, with buffer overflow checking

Synopsis

```
#include <stdlib.h>
char * __realpath_chk(const char * path, char * resolved_path, size_t
resolved_len);
```

Description

The interface `__realpath_chk()` shall function in the same way as the interface `realpath()`, except that `__realpath_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter `resolved_len` specifies the size of the string `resolved_path`. If `resolved_len` is less than `PATH_MAX`, then the function shall abort, and the program calling it shall exit.

The `__realpath_chk()` function is not in the source standard; it is only in the binary standard.

__recv_chk

Name

`__recv_chk` — receive a message from a socket, with buffer overflow checking

Synopsis

```
#include <sys/socket.h>
ssize_t __recv_chk(int fd, void * buf, size_t len, size_t buflen, int
flag);
```

Description

The interface `__recv_chk()` shall function in the same way as the interface `recv()`, except that `__recv_chk()` shall check for buffer overflow before computing a result, depending on the value of the `flag` parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of `flag`, the more security measures this interface shall take in the form of checking the buffer, parameter values, and so on.

The parameter `buflen` specifies the size of the buffer `buf`. If `len` exceeds `buflen`, the function shall abort, and the program calling it shall exit.

The `__recv_chk()` function is not in the source standard; it is only in the binary standard.

__recvfrom_chk

Name

`__recvfrom_chk` — receive a message from a socket, with buffer overflow checking

Synopsis

```
#include <sys/socket.h>
ssize_t __recvfrom_chk(int fd, void * buf, size_t len, size_t buflen,
int flag, struct sockaddr * from, socklen_t * fromlen);
```

Description

The interface `__recvfrom_chk()` shall function in the same way as the interface `recvfrom()`, except that `__recvfrom_chk()` shall check for buffer overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the buffer, parameter values, and so on.

The parameter *buflen* specifies the size of the buffer *buf*. If *len* exceeds *buflen*, the function shall abort, and the program calling it shall exit.

The `__recvfrom_chk()` function is not in the source standard; it is only in the binary standard.

__register_atfork

Name

`__register_atfork` — alias for `register_atfork`

Synopsis

```
int __register_atfork(void (*prepare) (void), void (*parent) (void),
void (*child) (void), void *__dso_handle);
```

Description

`__register_atfork()` implements `pthread_atfork()` as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). The additional parameter *__dso_handle* allows a shared object to pass in its handle so that functions registered by `__register_atfork()` can be unregistered by the runtime when the shared object is unloaded.

__sigsetjmp

Name

`__sigsetjmp` — save stack context for non-local goto

Synopsis

```
int __sigsetjmp(jmp_buf env, int savemask);
```

Description

`__sigsetjmp()` has the same behavior as `sigsetjmp()` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__sigsetjmp()` is not in the source standard; it is only in the binary standard.

__snprintf_chk

Name

`__snprintf_chk` — convert formatted output, with buffer overflow checking

Synopsis

```
#include <stdio.h>
int __snprintf_chk(char * str, size_t maxlen, int flag, size_t strlen,
const char * format);
```

Description

The interface `__snprintf_chk()` shall function in the same way as the interface `snprintf()`, except that `__snprintf_chk()` shall check for buffer overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the buffer, parameter values, and so on.

The parameter *strlen* specifies the size of the buffer *str*. If *strlen* is less than *maxlen*, the function shall abort, and the program calling it shall exit.

The `__snprintf_chk()` function is not in the source standard; it is only in the binary standard.

__sprintf_chk

Name

__sprintf_chk — convert formatted output, with stack checking

Synopsis

```
#include <stdio.h>
int __sprintf_chk(char * str, int flag, size_t strlen, const char *
format);
```

Description

The interface __sprintf_chk() shall function in the same way as the interface sprintf(), except that __sprintf_chk() shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *strlen* specifies the size of the string *str*. If *strlen* is zero, the function shall abort, and the program calling it shall exit.

The __sprintf_chk() function is not in the source standard; it is only in the binary standard.

__stack_chk_fail

Name

__stack_chk_fail — terminate a function in case of stack overflow

Synopsis

```
void __stack_chk_fail(void);
```

Description

The interface __stack_chk_fail() shall abort the function that called it with a message that a stack overflow has been detected. The program that called the function shall then exit.

The __stack_chk_fail() function is not in the source standard; it is only in the binary standard.

Application Usage (informative)

The interface __stack_chk_fail() does not check for a stack overflow itself. It merely reports one when invoked.

__stpcpy

Name

`__stpcpy` — alias for `stpcpy`

Synopsis

```
#include <string.h>
char * __stpcpy(char * dest, const char * src);
```

Description

The `__stpcpy()` function has the same specification as the `stpcpy()`.

`__stpcpy()` is not in the source standard; it is only in the binary standard.

__stpcpy_chk

Name

`__stpcpy_chk` — copy a string returning a pointer to its end, with buffer overflow checking

Synopsis

```
#include <string.h>
char * __stpcpy_chk(char * dest, const char * src, size_t destlen);
```

Description

The interface `__stpcpy_chk()` shall function in the same way as the interface `stpcpy()`, except that `__stpcpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The `__stpcpy_chk()` function is not in the source standard; it is only in the binary standard.

__stpncpy_chk

Name

__stpncpy_chk — copy a fixed-size string, returning a pointer to its end, with buffer overflow checking

Synopsis

```
#include <string.h>
char * __stpncpy_chk(char * dest, const char * src, size_t n, size_t
destlen);
```

Description

The interface **__stpncpy_chk()** shall function in the same way as the interface **stpncpy()**, except that **__stpncpy_chk()** shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *n* exceeds *destlen*, the function shall abort, and the program calling it shall exit.

The **__stpncpy_chk()** function is not in the source standard; it is only in the binary standard.

__strcat_chk

Name

__strcat_chk — concatenate two strings, with buffer overflow checking

Synopsis

```
#include <string.h>
char * __strcat_chk(char * dest, const char * src, size_t destlen);
```

Description

The interface **__strcat_chk()** shall function in the same way as the interface **strcat()**, except that **__strcat_chk()** shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The **__strcat_chk()** function is not in the source standard; it is only in the binary standard.

__strcpy_chk

Name

`__strcpy_chk` — copy a string, with buffer overflow checking

Synopsis

```
#include <string.h>
char * __strcpy_chk(char * dest, const char * src, size_t destlen);
```

Description

The interface `__strcpy_chk()` shall function in the same way as the interface `strcpy()`, except that `__strcpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The `__strcpy_chk()` function is not in the source standard; it is only in the binary standard.

__strdup

Name

`__strdup` — alias for `strdup`

Synopsis

```
char * __strdup(const char * string);
```

Description

`__strdup()` has the same specification as `strdup()`.

`__strdup()` is not in the source standard; it is only in the binary standard.

__strncat_chk

Name

`__strncat_chk` — concatenate two strings, with buffer overflow checking

Synopsis

```
#include <string.h>
char * __strncat_chk(char * s1, const char * s2, size_t n, size_t
sllen);
```

Description

The interface `__strncat_chk()` shall function in the same way as the interface `strncat()`, except that `__strncat_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *sllen* specifies the size of the object pointed to by *s1*.

The `__strncat_chk()` function is not in the source standard; it is only in the binary standard.

__strncpy_chk

Name

`__strncpy_chk` — copy a string, with buffer overflow checking

Synopsis

```
#include <string.h>
char * __strncpy_chk(char * s1, const char * s2, size_t n, size_t
sllen);
```

Description

The interface `__strncpy_chk()` shall function in the same way as the interface `strncpy()`, except that `__strncpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *sllen* specifies the size of the object pointed to by *s1*.

The `__strncpy_chk()` function is not in the source standard; it is only in the binary standard.

__strtod_internal

Name

`__strtod_internal` — underlying function for `strtod`

Synopsis

```
double __strtod_internal(const char * __nptr, char * * __endptr, int
__group);
```

Description

`__group` shall be 0 or the behavior of `__strtod_internal()` is undefined.

`__strtod_internal(__nptr, __endptr, 0)()` has the same specification as `strtod(__nptr, __endptr)()`.

`__strtod_internal()` is not in the source standard; it is only in the binary standard.

__strtof_internal

Name

`__strtof_internal` — underlying function for `strtof`

Synopsis

```
float __strtof_internal(const char * __nptr, char * * __endptr, int
__group);
```

Description

`__group` shall be 0 or the behavior of `__strtof_internal()` is undefined.

`__strtof_internal(__nptr, __endptr, 0)()` has the same specification as `strtof(__nptr, __endptr)()`.

`__strtof_internal()` is not in the source standard; it is only in the binary standard.

__strtok_r

Name

`__strtok_r` — alias for `strtok_r`

Synopsis

```
char * __strtok_r(char * restrict s, const char * restrict delim,
char * * restrict save_ptr);
```

Description

`__strtok_r()` has the same specification as `strtok_r()`.

`__strtok_r()` is not in the source standard; it is only in the binary standard.

__strtol_internal**Name**

`__strtol_internal` — alias for `strtol`

Synopsis

```
long int __strtol_internal(const char * __nptr, char * * __endptr, int
__base, int __group);
```

Description

`__group` shall be 0 or the behavior of `__strtol_internal()` is undefined.

`__strtol_internal(__nptr, __endptr, __base, 0)` has the same specification as `strtol(__nptr, __endptr, __base)`.

`__strtol_internal()` is not in the source standard; it is only in the binary standard.

__strtold_internal**Name**

`__strtold_internal` — underlying function for `strtold`

Synopsis

```
long double __strtold_internal(const char * __nptr, char * * __endptr,
int __group);
```

Description

`__group` shall be 0 or the behavior of `__strtold_internal()` is undefined.

`__strtold_internal(__nptr, __endptr, 0)` has the same specification as `strtold(__nptr, __endptr)`.

`__strtold_internal()` is not in the source standard; it is only in the binary standard.

__strtoll_internal**Name**

`__strtoll_internal` — underlying function for `strtoll`

Synopsis

```
long long __strtoll_internal(const char * __nptr, char * * __endptr, int
__base, int __group);
```

Description

`__group` shall be 0 or the behavior of `__strtoll_internal()` is undefined.

`__strtoll_internal(__nptr, __endptr, __base, 0)` has the same specification as `strtoll(__nptr, __endptr, __base)`.

`__strtoll_internal()` is not in the source standard; it is only in the binary standard.

__strtoul_internal**Name**

`__strtoul_internal` — underlying function for `strtoul`

Synopsis

```
unsigned long int __strtoul_internal(const char * __nptr, char * *
__endptr, int __base, int __group);
```

Description

`__group` shall be 0 or the behavior of `__strtoul_internal()` is undefined.

`__strtoul_internal(__nptr, __endptr, __base, 0)` has the same specification as `strtoul(__nptr, __endptr, __base)`.

`__strtoul_internal()` is not in the source standard; it is only in the binary standard.

__strtoull_internal**Name**

`__strtoull_internal` — underlying function for `strtoull`

Synopsis

```
unsigned long long __strtoull_internal(const char * __nptr, char * *
__endptr, int __base, int __group);
```

Description

`__group` shall be 0 or the behavior of `__strtoull_internal()` is undefined.

`__strtoull_internal(__nptr, __endptr, __base, 0)` has the same specification as `strtoull(__nptr, __endptr, __base)`.

`__strtoull_internal()` is not in the source standard; it is only in the binary standard.

__swprintf_chk

Name

`__swprintf_chk` — convert formatted wide-character output, with stack checking

Synopsis

```
#include <wchar.h>
int __swprintf_chk(wchar_t * s, size_t n, int flag, size_t slen, const
wchar_t * format);
```

Description

The interface `__swprintf_chk()` shall function in the same way as the interface `swprintf()`, except that `__swprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If *slen* is less than *maxlen*, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__swprintf_chk()` function is not in the source standard; it is only in the binary standard.

__sysconf

Name

`__sysconf` — get configuration information at runtime

Synopsis

```
#include <unistd.h>
long __sysconf(int name);
```

Description

`__sysconf()` gets configuration information at runtime.

`__sysconf()` is weak alias to `sysconf()`.

`__sysconf()` has the same specification as `sysconf()`.

`__sysconf()` is not in the source standard; it is only in the binary standard.

__syslog_chk

Name

`__syslog_chk` — send messages to the system logger, with stack checking

Synopsis

```
#include <syslog.h>
void __syslog_chk(int priority, int flag, const char * format);
```

Description

The interface `__syslog_chk()` shall function in the same way as the interface `syslog()`, except that `__syslog_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__syslog_chk()` function is not in the source standard; it is only in the binary standard.

__sysv_signal

Name

`__sysv_signal` — signal handling

Synopsis

```
__sighandler_t __sysv_signal(int sig, __sighandler_t handler);
```

Description

`__sysv_signal()` has the same behavior as `signal()` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__sysv_signal()` is not in the source standard; it is only in the binary standard.

__timezone

Name

`__timezone` — external variable containing timezone

Synopsis

```
long int __timezone;
```

Description

The external variable `__timezone` shall implement the `timezone` variable as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). `__timezone` has the same specification as `timezone`.

__ttyname_r_chk**Name**

`__ttyname_r_chk` — return name of a terminal, with buffer overflow checking (reentrant)

Synopsis

```
#include <unistd.h>
int __ttyname_r_chk(int fd, char * buf, size_t buflen, size_t nreal);
```

Description

The interface `__ttyname_r_chk()` shall function in the same way as the interface `ttyname_r()`, except that `__ttyname_r_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the object pointed to by *buf*. If *buflen* exceeds *nreal*, the function shall abort and the program calling it shall exit.

The `__ttyname_r_chk()` function is not in the source standard; it is only in the binary standard.

__tzname**Name**

`__tzname` — external variable containing the timezone names

Synopsis

```
char * __tzname[2];
```

Description

The external variable `__tzname` shall implement the timezone name variable `tzname` as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009) function `tzset()`. `__tzname` has the same specification as `tzname`.

__vfprintf_chk

Name

`__vfprintf_chk` — convert formatted output, with stack checking

Synopsis

```
#include <stdio.h>
int __vfprintf_chk(FILE * fp, int flag, const char * format, va_list
ap);
```

Description

The interface `__vfprintf_chk()` shall function in the same way as the interface `vfprintf()`, except that `__vfprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__vfprintf_chk()` function is not in the source standard; it is only in the binary standard.

__vfwprintf_chk

Name

`__vfwprintf_chk` — convert formatted wide-character output, with stack checking

Synopsis

```
#include <wchar.h>
int __vfwprintf_chk(FILE * fp, int flag, const wchar_t * format,
va_list ap);
```

Description

The interface `__vfwprintf_chk()` shall function in the same way as the interface `vfwprintf()`, except that `__vfwprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__vfwprintf_chk()` function is not in the source standard; it is only in the binary standard.

__vprintf_chk

Name

`__vprintf_chk` — convert formatted output, with stack checking

Synopsis

```
#include <stdio.h>
int __vprintf_chk(int flag, const char * format, va_list ap);
```

Description

The interface `__vprintf_chk()` shall function in the same way as the interface `vprintf()`, except that `__vprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__vprintf_chk()` function is not in the source standard; it is only in the binary standard.

__vsnprintf_chk

Name

`__vsnprintf_chk` — convert formatted output, with stack checking

Synopsis

```
#include <stdio.h>
int __vsnprintf_chk(char * s, size_t maxlen, int flag, size_t slen,
const char * format, va_list args);
```

Description

The interface `__vsnprintf_chk()` shall function in the same way as the interface `vsnprintf()`, except that `__vsnprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If *slen* is less than *maxlen*, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__vsnprintf_chk()` function is not in the source standard; it is only in the binary standard.

__vsprintf_chk

Name

__vsprintf_chk — convert formatted output, with stack checking

Synopsis

```
#include <stdio.h>
int __vsprintf_chk(char * s, int flag, size_t slen, const char * format,
va_list args);
```

Description

The interface `__vsprintf_chk()` shall function in the same way as the interface `vsprintf()`, except that `__vsprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If its value is zero, the function shall abort and the program calling it shall exit.

The `__vsprintf_chk()` function is not in the source standard; it is only in the binary standard.

__vswprintf_chk

Name

__vswprintf_chk — convert formatted wide-character output, with stack checking

Synopsis

```
#include <wchar.h>
int __vswprintf_chk(wchar_t * s, size_t maxlen, int flag, size_t slen,
const wchar_t * format, va_list args);
```

Description

The interface `__vswprintf_chk()` shall function in the same way as the interface `vswprintf()`, except that `__vswprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The parameter *slen* specifies the size of the object pointed to by *s*. If *slen* is less than *maxlen*, the function shall abort and the program calling it shall exit.

The `__vswprintf_chk()` function is not in the source standard; it is only in the binary standard.

__vsyslog_chk

Name

`__vsyslog_chk` — send messages to the system logger, with stack checking

Synopsis

```
#include <syslog.h>
void __vsyslog_chk(int priority, int flag, const char * format, va_list
ap);
```

Description

The interface `__vsyslog_chk()` shall function in the same way as the interface `vsyslog()`, except that `__vsyslog_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__vsyslog_chk()` function is not in the source standard; it is only in the binary standard.

__vwprintf_chk

Name

`__vwprintf_chk` — convert formatted wide-character output, with stack checking

Synopsis

```
#include <wchar.h>
int __vwprintf_chk(int flag, const wchar_t * format, va_list ap);
```

Description

The interface `__vwprintf_chk()` shall function in the same way as the interface `vwprintf()`, except that `__vwprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__vwprintf_chk()` function is not in the source standard; it is only in the binary standard.

__wpcpy_chk

Name

`__wpcpy_chk` — copy a wide-character string, returning a pointer to its end, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wpcpy_chk(wchar_t * dest, const wchar_t * src, size_t
destlen);
```

Description

The interface `__wpcpy_chk()` shall function in the same way as the interface `wpcpy()`, except that `__wpcpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The `__wpcpy_chk()` function is not in the source standard; it is only in the binary standard.

__wcpncpy_chk

Name

`__wcpncpy_chk` — copy a fixed-size string of wide characters, returning a pointer to its end, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wcpncpy_chk(wchar_t * dest, const wchar_t * src, size_t
n, size_t destlen);
```

Description

The interface `__wcpncpy_chk()` shall function in the same way as the interface `wcpncpy()`, except that `__wcpncpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *n* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The `__wcpncpy_chk()` function is not in the source standard; it is only in the binary standard.

__wrtomb_chk

Name

`__wrtomb_chk` — convert a wide character to a multibyte sequence, with buffer overflow checking

Synopsis

```
#include <wchar.h>
size_t __wrtomb_chk(char * s, wchar_t wchar, mbstate_t * ps, size_t
buflen);
```

Description

The interface `__wrtomb_chk()` shall function in the same way as the interface `wrtomb()`, except that `__wrtomb_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the object pointed to by *s*. If it is less than `MB_CUR_MAX`, then the function shall abort and the program calling it shall exit.

The `__wrtomb_chk()` function is not in the source standard; it is only in the binary standard.

__wscat_chk

Name

`__wscat_chk` — concatenate two wide-character strings, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wscat_chk(wchar_t * dest, const wchar_t * src, size_t
destlen);
```

Description

The interface `__wscat_chk()` shall function in the same way as the interface `wscat()`, except that `__wscat_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The `__wscat_chk()` function is not in the source standard; it is only in the binary standard.

__wscpy_chk

Name

`__wscpy_chk` — copy a wide-character string, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wscpy_chk(wchar_t * dest, const wchar_t * src, size_t
n);
```

Description

The interface `__wscpy_chk()` shall function in the same way as the interface `wscpy()`, except that `__wscpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The `__wscpy_chk()` function is not in the source standard; it is only in the binary standard.

__wcnecat_chk

Name

`__wcnecat_chk` — concatenate two wide-character strings, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wcnecat_chk(wchar_t * dest, const wchar_t * src, size_t
n, size_t destlen);
```

Description

The interface `__wcnecat_chk()` shall function in the same way as the interface `wcnecat()`, except that `__wcnecat_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*.

The `__wcnecat_chk()` function is not in the source standard; it is only in the binary standard.

__wcsncpy_chk

Name

`__wcsncpy_chk` — copy a fixed-size string of wide characters, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wcsncpy_chk(wchar_t * dest, const wchar_t * src, size_t
n, size_t destlen);
```

Description

The interface `__wcsncpy_chk()` shall function in the same way as the interface `wcsncpy()`, except that `__wcsncpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The `__wcsncpy_chk()` function is not in the source standard; it is only in the binary standard.

__wcsnrtombs_chk

Name

`__wcsnrtombs_chk` — convert a wide-character string to a multibyte string, with buffer overflow checking

Synopsis

```
#include <wchar.h>
size_t __wcsnrtombs_chk(char * dest, const wchar_t * * src, size_t
nwc, size_t len, mbstate_t * ps, size_t destlen);
```

Description

The interface `__wcsnrtombs_chk()` shall function in the same way as the interface `wcsnrtombs()`, except that `__wcsnrtombs_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The `__wcsnrtombs_chk()` function is not in the source standard; it is only in the binary standard.

__wcsrtombs_chk

Name

__wcsrtombs_chk — convert a wide-character string to a multibyte string, with buffer overflow checking

Synopsis

```
#include <wchar.h>
size_t __wcsrtombs_chk(char * dest, const wchar_t * * src, size_t len,
mbstate_t * ps, size_t destlen);
```

Description

The interface **__wcsrtombs_chk()** shall function in the same way as the interface **wcsrtombs()**, except that **__wcsrtombs_chk()** shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The **__wcsrtombs_chk()** function is not in the source standard; it is only in the binary standard.

__wcstod_internal

Name

__wcstod_internal — underlying function for **wcstod**

Synopsis

```
double __wcstod_internal(const wchar_t * nptr, wchar_t * * endptr, int
group);
```

Description

group shall be 0 or the behavior of **__wcstod_internal()** is undefined.

__wcstod_internal(nptr, endptr, 0) shall behave as **wcstod(nptr, endptr)** as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

__wcstod_internal() is not in the source standard; it is only in the binary standard.

__wcstof_internal**Name**

`__wcstof_internal` — underlying function for `wcstof`

Synopsis

```
float __wcstof_internal(const wchar_t * nptr, wchar_t * * endptr, int
group);
```

Description

group shall be 0 or the behavior of `__wcstof_internal()` is undefined.

`__wcstof_internal(nptr, endptr, 0)` shall behave as `wcstof(nptr, endptr)` as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__wcstof_internal()` is not in the source standard; it is only in the binary standard.

__wcstol_internal**Name**

`__wcstol_internal` — underlying function for `wcstol`

Synopsis

```
long __wcstol_internal(const wchar_t * nptr, wchar_t * * endptr, int
base, int group);
```

Description

group shall be 0 or the behavior of `__wcstol_internal()` is undefined.

`__wcstol_internal(nptr, endptr, base, 0)` shall behave as `wcstol(nptr, endptr, base)` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__wcstol_internal()` is not in the source standard; it is only in the binary standard.

__wcstold_internal

Name

`__wcstold_internal` — underlying function for `wcstold`

Synopsis

```
long double __wcstold_internal(const wchar_t * nptr, wchar_t * * endptr,
int group);
```

Description

group shall be 0 or the behavior of `__wcstold_internal()` is undefined.

`__wcstold_internal(nptr, endptr, 0)` shall behave as `wcstold(nptr, endptr)` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__wcstold_internal()` is not in the source standard; it is only in the binary standard.

__wcstombs_chk

Name

`__wcstombs_chk` — convert a wide-character string to a multibyte string, with buffer overflow checking

Synopsis

```
#include <stdlib.h>
size_t __wcstombs_chk(char * dest, const wchar_t * src, size_t len,
size_t destlen);
```

Description

The interface `__wcstombs_chk()` shall function in the same way as the interface `wcstombs()`, except that `__wcstombs_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *dest*. If *len* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The `__wcstombs_chk()` function is not in the source standard; it is only in the binary standard.

__wctoul_internal

Name

`__wctoul_internal` — underlying function for `wctoul`

Synopsis

```
unsigned long __wctoul_internal(const wchar_t * restrict nptr,
wchar_t * * restrict endptr, int base, int group);
```

Description

group shall be 0 or the behavior of `__wctoul_internal()` is undefined.

`__wctoul_internal(nptr, endptr, base, 0)()` shall behave as `wctoul(nptr, endptr, base)()` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__wctoul_internal()` is not in the source standard; it is only in the binary standard.

__wctomb_chk

Name

`__wctomb_chk` — convert a wide character to a multibyte sequence, with buffer overflow checking

Synopsis

```
#include <stdlib.h>
int __wctomb_chk(char * s, wchar_t wchar, size_t buflen);
```

Description

The interface `__wctomb_chk()` shall function in the same way as the interface `wctomb()`, except that `__wctomb_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *buflen* specifies the size of the object pointed to by *s*. If it is less than `MB_CUR_MAX`, then the function shall abort and the program calling it shall exit.

The `__wctomb_chk()` function is not in the source standard; it is only in the binary standard.

__wmemcpy_chk

Name

`__wmemcpy_chk` — copy an array of wide-characters, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wmemcpy_chk(wchar_t * s1, const wchar_t * s2, size_t n,
size_t nsl);
```

Description

The interface `__wmemcpy_chk()` shall function in the same way as the interface `wmemcpy()`, except that `__wmemcpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *nsl* specifies the size of the object pointed to by *s1*. If *n* exceeds *nsl*, the function shall abort and the program calling it shall exit.

The `__wmemcpy_chk()` function is not in the source standard; it is only in the binary standard.

__wmemmove_chk

Name

`__wmemmove_chk` — copy an array of wide-characters, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wmemmove_chk(wchar_t * s1, const wchar_t * s2, size_t n,
size_t nsl);
```

Description

The interface `__wmemmove_chk()` shall function in the same way as the interface `wmemmove()`, except that `__wmemmove_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *nsl* specifies the size of the object pointed to by *s1*. If *n* exceeds *nsl*, the function shall abort and the program calling it shall exit.

The `__wmemmove_chk()` function is not in the source standard; it is only in the binary standard.

__wmemcpy_chk**Name**

`__wmemcpy_chk` — copy memory area, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wmemcpy_chk(wchar_t * s1, const wchar_t * s2, size_t n,
size_t ns1);
```

Description

The interface `__wmemcpy_chk()` shall function in the same way as the interface `wmemcpy()`, except that `__wmemcpy_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *ns1* specifies the size of the object pointed to by *s1*. If *n* exceeds *ns1*, the function shall abort and the program calling it shall exit.

The `__wmemcpy_chk()` function is not in the source standard; it is only in the binary standard.

__wmemset_chk**Name**

`__wmemset_chk` — fill an array of wide-characters with a constant wide character, with buffer overflow checking

Synopsis

```
#include <wchar.h>
wchar_t * __wmemset_chk(wchar_t * s, wchar_t c, size_t n, size_t
destlen);
```

Description

The interface `__wmemset_chk()` shall function in the same way as the interface `wmemset()`, except that `__wmemset_chk()` shall check for buffer overflow before computing a result. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

The parameter *destlen* specifies the size of the object pointed to by *s*. If *n* exceeds *destlen*, the function shall abort and the program calling it shall exit.

The `__wmemset_chk()` function is not in the source standard; it is only in the binary standard.

__wprintf_chk

Name

`__wprintf_chk` — convert formatted wide-character output, with stack checking

Synopsis

```
#include <wchar.h>
int __wprintf_chk(int flag, const wchar_t * format);
```

Description

The interface `__wprintf_chk()` shall function in the same way as the interface `wprintf()`, except that `__wprintf_chk()` shall check for stack overflow before computing a result, depending on the value of the *flag* parameter. If an overflow is anticipated, the function shall abort and the program calling it shall exit.

In general, the higher the value of *flag*, the more security measures this interface shall take in the form of checking the stack, parameter values, and so on.

The `__wprintf_chk()` function is not in the source standard; it is only in the binary standard.

__xmknod

Name

`__xmknod` — make a special file

Synopsis

```
#include <sys/stat.h>
int __xmknod(int ver, const char * path, mode_t mode, dev_t * dev);
```

Description

The `__xmknod()` function shall implement the `mknod()` interface. The behavior of `__xmknod()` for values of *ver* other than `_MKNOD_VER` is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of `_MKNOD_VER`.

`__xmknod(_MKNOD_VER, path, mode, dev)` shall behave as `mknod(path, mode, dev)` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

The `__xmknod()` function is not in the source standard; it is only in the binary standard.

Note: The `mknod()` function is not in the binary standard; it is only in the source standard.

__xmknodat

Name

__xmknodat — make a special file relative to a directory file descriptor

Synopsis

```
#include <sys/stat.h>
int __xmknodat(int ver, int dirfd, const char * path, mode_t path,
dev_t * dev);
```

Description

The __xmknodat() function shall implement the mknodat() function. The behavior of __xmknodat() for values of *ver* other than _MKNOD_VER is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of _MKNOD_VER.

__xmknodat(_MKNOD_VER, dirfd, path, mode, dev) shall behave as mknodat(dirfd, path, mode, dev) as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

The __xmknodat() function is not in the source standard; it is only in the binary standard.

Note: The mknodat() function is not in the binary standard; it is only in the source standard.

__xpg_basename

Name

__xpg_basename — return the last component of a file name

Synopsis

```
#include <libgen.h>
char * __xpg_basename(const char * path);
```

Description

The __xpg_basename() function shall return a pointer to the final component of the pathname named by *path*, as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009) `basename()`.

This function is not in the source standard, it is only in the binary standard.

Return Value

See POSIX 1003.1-2008 (ISO/IEC 9945-2009).

__xpg_sigpause

Name

`__xpg_sigpause` — remove a signal from the signal mask and suspend the thread

Synopsis

```
#include <signal.h>
int __xpg_sigpause(int sig);
```

Description

The `__xpg_sigpause()` function shall implement the `sigpause()` described in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

This function is not in the source standard, it is only in the binary standard.

Return Value

See POSIX 1003.1-2008 (ISO/IEC 9945-2009).

__xpg_strerror_r

Name

`__xpg_strerror_r` — return string describing error number

Synopsis

```
#include <string.h>
int __xpg_strerror_r(int errnum, char * buf, size_t buflen);
```

Description

The `__xpg_strerror_r()` function shall map the error number in *errnum* to a locale-dependent error message string and shall return the string in the buffer pointed to by *strerrbuf*, with length *buflen*, as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009) `strerror_r()`.

This function is not in the source standard, it is only in the binary standard.

Return Value

See POSIX 1003.1-2008 (ISO/IEC 9945-2009).

__xstat

Name

`__xstat` — get File Status

Synopsis

```
#include <sys/stat.h>
```

```
#include <unistd.h>
int __xstat(int ver, const char * path, struct stat * stat_buf);
int __lxstat(int ver, const char * path, struct stat * stat_buf);
int __fxstat(int ver, int fildes, struct stat * stat_buf);
```

Description

The functions `__xstat()`, `__lxstat()`, and `__fxstat()` shall implement the functions `stat()`, `lstat()`, and `fstat()` respectively.

The behavior of these functions for values of `ver` other than `_STAT_VER` is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of `_STAT_VER`.

`__xstat(_STAT_VER, path, stat_buf)` shall implement `stat(path, stat_buf)` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__lxstat(_STAT_VER, path, stat_buf)` shall implement `lstat(path, stat_buf)` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__fxstat(_STAT_VER, fildes, stat_buf)` shall implement `fstat(fildes, stat_buf)` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`__xstat()`, `__lxstat()`, and `__fxstat()` are not in the source standard; they are only in the binary standard.

`stat()`, `lstat()`, and `fstat()` are not in the binary standard; they are only in the source standard.

__xstat64

Name

`__xstat64` — get File Status

Synopsis

```
#define _LARGEFILE_SOURCE 1
#include <sys/stat.h>
```

```
#include <unistd.h>
int __xstat64(int ver, const char * path, struct stat64 * stat_buf);
int __lxstat64(int ver, const char * path, struct stat64 * stat_buf);
int __fxstat64(int ver, int fildes, struct stat64 * stat_buf);
```

Description

The functions `__xstat64()`, `__lxstat64()`, and `__fxstat64()` shall implement the functions `stat64()`, `lstat64()`, and `fstat64()` respectively.

The behavior of these functions for values of `ver` other than `_STAT_VER` is undefined. See Data Definitions in the architecture specific part of this specification for the correct value of `_STAT_VER`.

`__xstat64(_STAT_VER, path, stat_buf)` shall behave as `stat64(path, stat_buf)` as specified by Large File Support.

`__lxstat64(_STAT_VER, path, stat_buf)` shall behave as `lstat64(path, stat_buf)` as specified by Large File Support.

`__fxstat64(_STAT_VER, fildes, stat_buf)` shall behave as `fstat64(fildes, stat_buf)` as specified by Large File Support.

`__xstat64()`, `__lxstat64()`, and `__fxstat64()` are not in the source standard; they are only in the binary standard.

`stat64()`, `lstat64()`, and `fstat64()` are not in the binary standard; they are only in the source standard.

`_environ`

Name

`_environ` — alias for `environ` - user environment

Synopsis

```
extern char * *_environ;
```

Description

`_environ` is an alias for `environ` - user environment.

`_nl_msg_cat_cntr`

Name

`_nl_msg_cat_cntr` — new catalog load counter

Synopsis

```
#include <libintl.h>

extern int _nl_msg_cat_cntr;
```

Description

The global variable `_nl_msg_cat_cntr` is incremented each time a new catalog is loaded. This variable is only in the binary standard; it is not in the source standard.

_sys_errlist

Name

`_sys_errlist` — array containing the "C" locale strings used by `strerror()`

Synopsis

```
#include <stdio.h>

extern const char *const _sys_errlist[];
```

Description

`_sys_errlist` is an array containing the "C" locale strings used by `strerror()`. This normally should not be used directly. `strerror()` provides all of the needed functionality.

_sys_siglist

Name

`_sys_siglist` — array containing the names of the signal names

Synopsis

```
#include <signal.h>

extern const char *const _sys_siglist[NSIG];
```

Description

`_sys_siglist` is an array containing signal description strings ordered by signal number.

The `_sys_siglist` array is only in the binary standard; it is not in the source standard. Applications wishing to access signal descriptions should use the `strsignal()` function.

acct**Name**

`acct` — switch process accounting on or off

Synopsis

```
#include <dirent.h>
int acct(const char * filename);
```

Description

When *filename* is the name of an existing file, `acct()` turns accounting on and appends a record to *filename* for each terminating process. When *filename* is `NULL`, `acct()` turns accounting off.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors**ENOSYS**

BSD process accounting has not been enabled when the operating system kernel was compiled. The kernel configuration parameter controlling this feature is `CONFIG_BSD_PROCESS_ACCT`.

ENOMEM

Out of memory.

EPERM

The calling process has no permission to enable process accounting.

EACCES

filename is not a regular file.

EIO

Error writing to the *filename*.

EUSERS

There are no more free file structures or we run out of memory.

adjtime

Name

adjtime — correct the time to allow synchronization of the system clock

Synopsis

```
#include <time.h>
int adjtime(const struct timeval * delta, struct timeval * olddelta);
```

Description

adjtime() makes small adjustments to the system time as returned by gettimeofday() (2), advancing or retarding it by the time specified by the timeval *delta*. If *delta* is negative, the clock is slowed down by incrementing it more slowly than normal until the correction is complete. If *delta* is positive, a larger increment than normal is used. The skew used to perform the correction is generally a fraction of one percent. Thus, the time is always a monotonically increasing function. A time correction from an earlier call to adjtime() may not be finished when adjtime() is called again. If *olddelta* is non-NULL, the structure pointed to will contain, upon return, the number of microseconds still to be corrected from the earlier call.

adjtime() may be used by time servers that synchronize the clocks of computers in a local area network. Such time servers would slow down the clocks of some machines and speed up the clocks of others to bring them to the average network time.

Appropriate privilege is required to adjust the system time.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors

EFAULT

An argument points outside the process's allocated address space.

EPERM

The process does not have appropriate privilege.

alphasort64

Name

alphasort64 — Comparison function for directory scanning (Large File Support)

Synopsis

```
#include <dirent.h>
int alphasort64(const struct dirent64 ** d1, const struct dirent64
** d2);
```

Description

alphasort64() is a large-file version of the alphasort() function as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It differs only in that the *d1* and *d2* parameters are of type `dirent64` instead of type `dirent`.

argz_add, argz_add_sep, argz_append, argz_count, argz_create, argz_create_sep, argz_delete, argz_extract, argz_insert, argz_next, argz_replace, argz_stringify

Name

argz_add, argz_add_sep, argz_append, argz_count, argz_create, argz_create_sep, argz_delete, argz_extract, argz_insert, argz_next, argz_replace, argz_stringify —
Operate on argz vectors

Synopsis

```
#include <argz.h>
error_t argz_add(char ** argz, size_t * argz_len, const char * str);
error_t argz_add_sep(char ** argz, size_t * argz_len, const char * str, int sep);
error_t argz_append(char ** argz, size_t * argz_len, const char * buf, size_t buf_len);
size_t argz_count(const char * argz, size_t * argz_len);
error_t argz_create(char * const argv, char ** argz, size_t * argz_len);
error_t argz_create_sep(const char * str, int sep, char ** argz, size_t * argz_len);
void argz_delete(char ** argz, size_t * argz_len, char * entry);
void argz_extract(const char * argz, size_t argz_len, char ** argv);
error_t argz_insert(char ** argz, size_t * argz_len, char * before, const char * entry);
char * argz_next(const char * argz, size_t argz_len, const char * entry);
error_t argz_replace(char ** argz, size_t * argz_len, const char * str, const char * with, unsigned int * replace_count);
void argz_stringify(char * argz, size_t argz_len, int sep);
```

Description

The argz functions operate on argz vectors, which are typically used to more easily manipulate program arguments, of the form described in ISO C (1999) in section 5.1.2.2.1, Program Startup. While an argv is an array of character pointers to strings, an argz vector is a set of strings, separated by null characters, in contiguous memory; the vector is described by a pointer to the first element and a size. There is no limitation that the argz must be made up of program arguments.

The argz functions which change argz vectors expect them to use memory allocated using malloc(), and will themselves use malloc() or realloc().

The argz_create() function converts an argv vector identified by argv to an argz vector with the same elements, identified by argz and argz_len.

The argz_create_sep() function converts the string identified by str, splitting into a separate string at each occurrence of sep, to an argz vector identified by argz and argz_len.

The argz_add() function adds the string identified by str to the vector identified by argz and argz_len, updating argz and argz_len.

The argz_add_sep() function adds the string identified by str, splitting into a separate string at each occurrence of sep, to the vector identified by argz, updating argz and argz_len.

The `argz_append()` function appends the `argz` vector identified by `buf` and `buf_len` to the `argz` vector identified by `argz` and `argz_len`, thus updating `argz` and `argz_len`.

The `argz_count()` function returns the number of strings in the `argz` vector identified by `argz` and `argz_len`.

The `argz_delete()` function removes the string identified by `entry` from the the `argz` vector identified by `argz`, `argz_len`, updating `argz` and `argz_len`.

The `argz_extract()` function performs the inverse of `argz_create()`. It converts an `argz` vector identified by `argz` and `argz_len` to an `argv` vector identified by `argv` with the same elements.

The `argz_insert()` function inserts the string identified by `entry` at position before to the the `argz` vector identified by `argz` and `argz_len`, updating `argz` and `argz_len`.

The `argz_next()` function returns the entry following the entry identified by `entry` in the `argz` vector identified by `argz` and `argz_len`. If `entry` is `NULL` the first entry is returned. This function can be used to step through an `argz` vector by obtaining the first entry by passing `NULL`, then passing the just obtained value to the next call, and so on. `NULL` is returned if there is no following entry.

The `argz_replace()` function replaces each occurrence of `str` in the `argz` vector identified by `argz` and `argz_len` with `with`, updating `argz` and `argz_len`. The counter pointed to by `replace_count` will be incremented by the number of replacements unless `NULL` is passed for `replace_count`.

The `argz_stringify()` function performs the inverse of `argz_create_sep()`. It converts the `argz` vector identified by `argz` and `argz_len` into a regular string, with the strings in the original vector separated by `sep` in the converted string. The conversion is done in place, so in effect each null byte in `argz` but the last one is replaced by `sep`.

Return Value

All of the `argz` functions that perform memory allocation return an `error_t` type. These functions return 0 on success; if memory allocation fails, they return `ENOMEM`.

`argz_count()` returns a count of substrings in the `argz` vector as a `size_t` type.

`argz_next()` returns a pointer to a substring in an `argz` vector, or `NULL`.

See Also

`envz_add`, `envz_entry`, `envz_get`, `envz_merge`, `envz_remove`, `envz_strip`

asprintf

Name

`asprintf` — write formatted output to a dynamically allocated string

Synopsis

```
#include <stdio.h>
int asprintf(char ** restrict ptr, const char * restrict format, ...);
```

Description

The `asprintf()` function shall behave as `sprintf()`, except that the output string shall be dynamically allocated space of sufficient length to hold the resulting string. The address of this dynamically allocated string shall be stored in the location referenced by *ptr*.

Return Value

Refer to `fprintf()`.

Errors

Refer to `fprintf()`.

backtrace, backtrace_symbols, backtrace_symbols_fd

Name

`backtrace`, `backtrace_symbols`, `backtrace_symbols_fd` — runtime stack back tracing

Synopsis

```
#include <execinfo.h>
int backtrace(void **array, int size);
char **backtrace_symbols(void *const *array, int size);
void backtrace_symbols_fd(void *const *array, int size, int fd);
```

Description

`backtrace()` obtains a backtrace for the current thread as a list of pointers filled in to *array*. The *size* parameter describes the number of elements that will fit into *array*; `backtrace()` will truncate the list if necessary. A backtrace is a list of currently active function calls in a thread; each function call allocates a new stack frame and `backtrace()` obtains the return address from each stack frame.

`backtrace_symbols()` translates the information obtained from `backtrace()` into an array of strings. *array* is a pointer to an array of addresses as obtained from `backtrace()`. *size* is the number of entries in *array*, and should be the return value of the call to `backtrace()`. The strings contain the function name if it can be determined, a hexadecimal offset into the function, and the actual return address in hexadecimal. Note that the pointer returned by `backtrace_symbols()` is obtained by an internal call to `malloc()` and should be freed when no longer needed.

`backtrace_symbols_fd()` performs the same transformation as `backtrace_symbols()` given the same argument pair *array*, *size*, but writes the strings to the file descriptor contained in *fd*. This avoids the allocation of string space.

Return Value

`backtrace()` returns the number of entries placed into *array*, no more than *size*. If the value is less than *size*, the full backtrace was returned; else it may have been truncated.

On success, `backtrace_symbols()` returns a pointer to an array of strings, which will have *size* entries. On error, `NULL` is returned.

Errors

No errors are defined for these functions. If `backtrace_symbols_fd()` fails, it will be due to a failure in the call to `malloc()`, and `errno` will be set accordingly.

Notes

The ability to obtain useful backtrace information, in particular function names, is dependent on a number of factors at the time of program construction, such as compiler optimization options. Even if the program itself is constructed so as to make symbols visible, the call trace may descend into system libraries which have not been so constructed.

Inlined functions do not have stack frames, and functions declared as static are not exposed and so will not be available in the backtrace.

`malloc()`

basename

Name

`basename` — return the last component of a file name

Synopsis

```
#include <libgen.h>
char * basename(const char * path);
```

Description

In the source standard, `basename()` is implemented as a macro causing it to behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), and is equivalent to the function `__xpg_basename()`. If the macro is undefined, `basename()` from the binary standard is used, with differences as described here:

The string identified by *path* shall not be modified.

If *path* is `"/"`, or ends with a trailing `'/'` character, the `basename()` function shall return a pointer to an empty string.

Return Value

On success, the `basename()` function shall return a pointer to the final component of *path*. Otherwise, it shall return a null pointer.

See Also

`__xpg_basename()`

bind_textdomain_codeset

Name

`bind_textdomain_codeset` — specify encoding for message retrieval

Synopsis

```
#include <libintl.h>
char * bind_textdomain_codeset (const char * domainname , const char *
codeset );
```

Description

The `bind_textdomain_codeset()` function can be used to specify the output codeset for message catalogs for domain *domainname*. The *codeset* argument shall be a valid codeset name which can be used for the *iconv_open* function, or a null pointer. If the *codeset* argument is the null pointer, then function returns the currently selected codeset for the domain with the name *domainname*. It shall return a null pointer if no codeset has yet been selected.

Each successive call to `bind_textdomain_codeset()` function overrides the settings made by the preceding call with the same *domainname*.

The `bind_textdomain_codeset()` function shall return a pointer to a string containing the name of the selected codeset. The string shall be allocated internally in the function and shall not be changed or freed by the user.

Parameters

domainname

The *domainname* argument is applied to the currently active LC_MESSAGE locale. It is equivalent in syntax and meaning to the *domainname* argument to *textdomain*, except that the selection of the domain is valid only for the duration of the call.

codeset

The name of the output codeset for the selected domain, or NULL to select the current codeset.

If *domainname* is the null pointer, or is an empty string, `bind_textdomain_codeset()` shall fail, but need not set *errno*.

Return Value

Returns the currently selected codeset name. It returns a null pointer if no codeset has yet been selected.

Errors

ENOMEM

Insufficient memory available to allocate return value.

See Also

gettext, dgettext, ngettext, dngettext, dcgettext, dcngettext, textdomain, bindtextdomain

bindresvport

Name

bindresvport — bind socket to privileged IP port

Synopsis

```
#include <sys/types.h>
#include <rpc/rpc.h>
int bindresvport(int sd, struct sockaddr_in * sin);
```

Description

If the process has appropriate privilege, the `bindresvport()` function shall bind a socket to an anonymous privileged IP port, that is, arbitrarily selected from the range 512 through 1023.

If the bind is successful and `sin` is not `NULL`, and the port number bound to is returned in the `sin_port` member of `sin`. Any caller-supplied value of `sin_port` is ignored.

If `sin` is `NULL`, the address family is taken to be `AF_INET` and an available privileged port is bound to. Since there is no `sockaddr_in` structure, the port number chosen cannot be returned. The `getsockname()` may be used to query for this information.

Return Value

On success, 0 is returned. On error, -1 is returned and `errno` is set to indicate the error.

Errors

`bindresvport()` may fail in the same way as `bind()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009). The following additional or differing failures may occur:

`EADDRINUSE`

All privileged ports are in use.

`EAFNOSUPPORT`

The specified address is not a valid address for the address family of the specified socket, or the address family is not supported.

`EPFNOSUPPORT`

The same meaning as `EAFNOSUPPORT`. Some older implementations may return this error instead.

Note: At this time, only `AF_INET` is supported. Applications should be prepared for either the `EAFNOSUPPORT` or `EPFNOSUPPORT` error to be indicated.

bindtextdomain

Name

`bindtextdomain` — specify the location of a message catalog

Synopsis

```
#include <libintl.h>
char * bindtextdomain(const char * domainname, const char * dirname);
```

Description

The `bindtextdomain()` shall set the the base directory of the hierarchy containing message catalogs for a given message domain.

The `bindtextdomain()` function specifies that the *domainname* message catalog can be found in the *dirname* directory hierarchy, rather than in the system default locale data base.

If *dirname* is not `NULL`, the base directory for message catalogs belonging to domain *domainname* shall be set to *dirname*. If *dirname* is `NULL`, the base directory for message catalogs shall not be altered.

The function shall make copies of the argument strings as needed.

dirname can be an absolute or relative pathname.

Note: Applications that wish to use `chdir()` should always use absolute pathnames to avoid misadventently selecting the wrong or non-existent directory.

If *domainname* is the null pointer, or is an empty string, `bindtextdomain()` shall fail, but need not set `errno`.

The `bindtextdomain()` function shall return a pointer to a string containing the name of the selected directory. The string shall be allocated internally in the function and shall not be changed or freed by the user.

Return Value

On success, `bindtextdomain()` shall return a pointer to a string containing the directory pathname currently bound to the domain. On failure, a `NULL` pointer is returned, and the global variable `errno` may be set to indicate the error.

Errors

`ENOMEM`

Insufficient memory was available.

See Also

`gettext`, `dgettext`, `ngettext`, `dngettext`, `dcgettext`, `dcngettext`, `textdomain`, `bind_textdomain_codeset`

cfmakeraw**Name**

`cfmakeraw` — get and set terminal attributes

Synopsis

```
#include <termios.h>
void cfmakeraw(struct termios * termios_p);
```

Description

The `cfmakeraw()` function shall set the attributes of the `termios` structure referenced by *termios_p* as follows:

```
termios_p->c_iflag &= ~(IGNBRK|BRKINT|PARMRK|ISTRIP
|INLCR|IGNCR|ICRNL|IXON);

termios_p->c_oflag &= ~OPOST;

termios_p->c_lflag &= ~(ECHO|ECHONL|ICANON|ISIG|IEXTEN);

termios_p->c_cflag &= ~(CSIZE|PARENB);

termios_p->c_cflag |= CS8;
```

termios_p shall point to a `termios` structure that contains the following members:

```
tcflag_t c_iflag;    /* input modes */
tcflag_t c_oflag;    /* output modes */
tcflag_t c_cflag;    /* control modes */
tcflag_t c_lflag;    /* local modes */
cc_t c_cc[NCCS];     /* control chars */
```

cfsetspeed

Name

`cfsetspeed` — set terminal input and output data rate

Synopsis

```
#include <termios.h>
int cfsetspeed(struct termios *t, speed_t speed);
```

Description

The `cfsetspeed()` function shall set the input and output speeds in `t` to the value specified by `speed`. The effects of the function on the terminal as described below do not become effective, nor are all errors detected, until the `tcsetattr()` function is called. Certain values for baud rates set in `termios` and passed to `tcsetattr()` have special meanings.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors

EINVAL

Invalid `speed` argument

clearerr_unlocked

Name

`clearerr_unlocked` — non-thread-safe `clearerr`

Description

`clearerr_unlocked()` is the same as `clearerr()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

daemon

Name

`daemon` — run in the background

Synopsis

```
#include <unistd.h>
int daemon(int nochdir, int noclose);
```

Description

The `daemon()` function shall create a new process, detached from the controlling terminal. If successful, the calling process shall exit and the new process shall continue to execute the application in the background. If *nochdir* evaluates to true, the current directory shall not be changed. Otherwise, `daemon()` shall change the current working directory to the root (`/`). If *noclose* evaluates to true the standard input, standard output, and standard error file descriptors shall not be altered. Otherwise, `daemon()` shall close the standard input, standard output and standard error file descriptors and reopen them attached to `/dev/null`.

Return Value

On error, -1 is returned, and the global variable `errno` is set to any of the errors specified for the library functions `fork()` and `setsid()`.

dcgettext

Name

`dcgettext` — perform domain and category specific lookup in message catalog

Synopsis

```
#include <libintl.h>
```

```
#include <locale.h>
char * dcgettext(const char * domainname, const char * msgid, int
category);
```

Description

The `dcgettext()` function is a domain specified version of `gettext()`.

The `dcgettext()` function shall lookup the translation in the current locale of the message identified by `msgid` in the domain specified by `domainname` and in the locale category specified by `category`. If `domainname` is NULL, the current default domain shall be used. The `msgid` argument shall be a NULL-terminated string to be matched in the catalogue. `category` shall specify the locale category to be used for retrieving message strings. The category parameter shall be one of `LC_CTYPE`, `LC_COLLATE`, `LC_MESSAGES`, `LC_MONETARY`, `LC_NUMERIC`, or `LC_TIME`. The default domain shall not be changed by a call to `dcgettext()`.

Return Value

If a translation was found in one of the specified catalogs, it shall be converted to the current locale's codeset and returned. The resulting NULL-terminated string shall be allocated by the `dcgettext` function, and must not be modified or freed. If no translation was found, or category was invalid, `msgid` shall be returned.

Errors

`dcgettext()` shall not modify the `errno` global variable.

See Also

`gettext`, `dgettext`, `ngettext`, `dngettext`, `dcngettext`, `textdomain`, `bindtextdomain`, `bind_textdomain_codeset`

dcngettext

Name

`dcngettext` — perform domain and category specific lookup in message catalog with plural

Synopsis

```
#include <libintl.h>
```

```
#include <locale.h>
char * dcngettext(const char * domainname, const char * msgid1, const
char * msgid2, unsigned long int n, int category);
```

Description

The `dcngettext()` function is a domain specific version of `gettext`, capable of returning either a singular or plural form of the message. The `dcngettext()` function shall lookup the translation in the current locale of the message identified by `msgid1` in the domain specified by `domainname` and in the locale category specified by `category`. If `domainname` is `NULL`, the current default domain shall be used. The `msgid1` argument shall be a `NULL`-terminated string to be matched in the catalogue. `category` shall specify the locale category to be used for retrieving message strings. The `category` parameter shall be one of `LC_CTYPE`, `LC_COLLATE`, `LC_MESSAGES`, `LC_MONETARY`, `LC_NUMERIC`, or `LC_TIME`. The default domain shall not be changed by a call to `dcngettext()`. If `n` is 1 then the singular version of the message is returned, otherwise one of the plural forms is returned, depending on the value of `n` and the current locale settings.

Return Value

If a translation corresponding to the value of `n` was found in one of the specified catalogs for `msgid1`, it shall be converted to the current locale's codeset and returned. The resulting `NULL`-terminated string shall be allocated by the `dcngettext()` function, and must not be modified or freed. If no translation was found, or `category` was invalid, `msgid1` shall be returned if `n` has the value 1, otherwise `msgid2` shall be returned.

Errors

`dcngettext()` shall not modify the `errno` global variable.

`gettext`, `dgettext`, `ngettext`, `dngettext`, `dcgettext`, `textdomain`, `bindtextdomain`, `bind_textdomain_codeset`

dgettext

Name

`dgettext` — perform lookup in message catalog for the current LC_MESSAGES locale

Synopsis

```
#include <libintl.h>
char * dgettext(const char * domainname, const char * msgid);
```

Description

`dgettext()` is a domain specified version of `gettext()`.

The `dgettext()` function shall search the currently selected message catalogs in the domain *domainname* for a string identified by the string *msgid*. If a string is located, that string shall be returned. The domain specified by *domainname* applies to the currently active LC_MESSAGE locale. The default domain shall not be changed by a call to `dgettext()`.

Note: The usage of *domainanme* is equivalent in syntax and meaning to the `textdomain()` function's application of *domainname*, except that the selection of the domain in `dgettext()` is valid only for the duration of the call.

The `dgettext()` function is equivalent to `dcgettext(domainname, msgid, LC_MESSAGES)`.

Return Value

On success of a *msgid* query, the translated NULL-terminated string is returned. On error, the original *msgid* is returned. The length of the string returned is undetermined until `dgettext()` is called.

Errors

`dgettext()` shall not modify the `errno` global variable.

See Also

`gettext`, `dgettext`, `ngettext`, `dngettext`, `dcgettext`, `dcngettext`, `textdomain`, `bindtextdomain`, `bind_textdomain_codeset`

dl_iterate_phdr

Name

`dl_iterate_phdr` — iterate over a program's loaded shared objects

Synopsis

```
#include <link.h>
int dl_iterate_phdr(int(*callback) (struct dl_phdr_info *, size_t,
void *), void *data);
```

Description

`dl_iterate_phdr()` allows a program to iterate over the shared objects it has loaded. The function described by the *callback* parameter is called once for each loaded shared object, allowing an action to be taken for each one. *callback* is called with three arguments which are filled in by the implementation: a pointer to a structure of type `dl_phdr_info` containing information about the shared object; an integer size of the structure; and a copy of the *data* argument to `dl_iterate_phdr()`. If *callback* returns a non-zero value, `dl_iterate_phdr()` will stop processing, even if there are unprocessed shared objects. The order of processing is unspecified.

The `dl_phdr_info` structure has the following members (note that on 64-bit architectures the types here shown as `Elf32_type` will instead be `Elf64_type`):

```
Elf32_Addr dlpi_addr;
const char *dlpi_name;
const Elf32_Phdr *dlpi_phdr;
Elf32_Half dlpi_phnum;
unsigned long long int dlpi_adds;
unsigned long long int dlpi_subs;
size_t dlpi_tls_modid;
```

```
void *dlpi_tls_data;
```

dlpi_addr contains the base address of the shared object.

dlpi_name is a null-terminated string giving the pathname from which the shared object was loaded.

dlpi_phdr is a pointer to an array of program headers for this shared object, while *dlpi_phnum* is the number of entries in this array.

dlpi_adds and *dlpi_subs* are incremented when shared objects are added or removed, respectively.

dlpi_tls_modid contains the module ID used in TLS relocations, if there is a PT_TLS segment. Otherwise the value shall be zero.

dlpi_tls_data contains the address of the calling thread's instance of this module's PT_TLS segment, if there is one and it has been allocated in the calling thread. Otherwise the value shall be a null pointer.

Some implementations may not provide all fields in *dl_phdr_info*, although the first four are always mandatory. Applications are advised to have the callback function check the size parameter before examining the later members.

Return Value

The `dl_iterate_phdr()` function returns whatever value was returned by the last call to *callback*. This will be zero if processing completed normally, since processing does not continue unless the callback function returns zero.

Errors

No errors are defined by `dl_iterate_phdr()`; as noted the callback function must use a zero return to indicate success but may assign any meaning it wishes to non-zero returns.

dngettext

Name

`dngettext` — perform lookup in message catalog for the current locale

Synopsis

```
#include <libintl.h>
char * dngettext(const char * domainname, const char * msgid1, const
char * msgid2, unsigned long int n);
```

Description

`dngettext()` shall be equivalent to a call to

```
dcngettext(domainname, msgid1, msgid2, n, LC_MESSAGES)
```

See `dcngettext()` for more information.

See Also

`gettext`, `dgettext`, `ngettext`, `dcgettext`, `dcngettext`, `textdomain`, `bindtextdomain`, `bind_textdomain_codeset`

drand48_r**Name**

`drand48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int drand48_r(struct drand48_data * buffer, double * result);
```

Description

The interface `drand48_r()` shall function in the same way as the interface `drand48()`, except that `drand48_r()` shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling `lcong48_r()`, `seed48_r()`, or `srand48_r()`, or by filling it with zeroes.

endutent**Name**

`endutent` — access utmp file entries

Synopsis

```
#include <utmp.h>
void endutent(void);
```

Description

`endutent()` closes the `utmp` file. It should be called when the user code is done accessing the file with the other functions.

envz_add, envz_entry, envz_get, envz_merge, envz_remove, envz_strip

Name

envz_add, envz_entry, envz_get, envz_merge, envz_remove, envz_strip — Operate on environment vectors

Synopsis

```
#include <envz.h>
error_t envz_add(char ** envz, size_t * envz_len, const char * name,
const char * value);
char envz_entry(const char * envz, size_t envz_len, const char * name);
char envz_get(const char * envz, size_t envz_len, const char * name);
error_t envz_merge(char ** envz, size_t * envz_len, const char * envz2,
size_t envz2_len, int override);
void envz_remove(char ** envz, size_t * envz_len, const char * name);
void envz_strip(char ** envz, size_t * envz_len);
```

Description

The envz functions operate on envz vectors, which are typically used to manipulate program environment variables.

An envz vector is identical in makeup to an argz vector (see argz_add, argz_add_sep, argz_append, argz_count, argz_create, argz_create_sep, argz_delete, argz_extract, argz_insert, argz_next, argz_replace, argz_stringify) but has the constraint that each element is a name, value pair separated by an = character. Only the first = character in an element has special meaning, any subsequent instances are part of the value string. If no = character is present in an element, the value is taken to be NULL. If an element has an empty value (an = character is present), the value will return the empty string "" when queried.

Since an envz vector is an argz vector, the argz functions can be used where it makes sense. For example, converting from a program's environment variables (as described in Chapter 8 of the XBD volume of POSIX 1003.1-2008 (ISO/IEC 9945-2009)) to an envz vector is done with argz_create().

The envz_add() function adds a string constructed from name and value in the form "name=value" to the envz vector identified by envz and envz_len, updating envz and envz_len. If value is NULL it adds a string of the form "name". If an entry with the same name already exists, it is replaced..

The envz_entry() function searches for name in the envz vector identified by envz and envz_len, returning the full entry if found, or NULL if not.

The envz_get() function searches for name in the envz vector identified by envz and envz_len, returning the value part of the entry if found, or NULL if not. Note the value may be also NULL.

The envz_merge() function adds each entry from the envz vector identified by envz2 and envz2_len to the envz vector identified by envz and envz_len, updating envz and envz_len. The behavior is as if envz_add() were called for each entry in envz2. If override is true, then values from envz2 will replace those with the same name in envz.

The envz_remove() function removes the entry for name from the envz vector identified by envz and envz_len if it exists, updating envz and envz_len.

The `envz_strip()` function removes all entries with value `NULL`.

Return Value

The `envz` functions that perform memory allocation (`envz_add()` and `envz_merge()`) return an `error_t` type. These functions return 0 on success; if memory allocation fails, they return `ENOMEM`.

`envz_entry()` and `envz_get()` return a pointer to a substring in an `envz` vector, or `NULL`.

See Also

`argz_add`, `argz_add_sep`, `argz_append`, `argz_count`, `argz_create`, `argz_create_sep`, `argz_delete`, `argz_extract`, `argz_insert`, `argz_next`, `argz_replace`, `argz_stringify`

epoll_create

Name

`epoll_create` — open an epoll file descriptor

Synopsis

```
#include <sys/epoll.h>
int epoll_create(int size);
```

Description

The epoll API, which consists of the interfaces `epoll_create()`, `epoll_ctl()`, and `epoll_wait()`, shall support all file descriptors compatible with `poll()`. These interfaces shall be usable in either level-triggered or edge-triggered mode. In level-triggered mode, epoll has similar semantics to `poll()`, and can be used as a faster replacement for it. In edge-triggered mode, epoll shall only report events for a file descriptor when changes occur on it.

The `epoll_create()` interface shall open an epoll file descriptor by allocating an event backing store of approximately size *size*. The *size* parameter is a hint to the kernel about how large the event storage should be, not a rigidly-defined maximum size.

Return Value

On success, `epoll_create()` shall return the file descriptor, a non-negative integer that shall be used for subsequent epoll calls. It should be closed with the `close()` function.

On failure, `epoll_create()` shall return -1 and set `errno` as follows.

Errors

EINVAL

The *size* parameter is not positive.

ENFILE

The maximum number of open files has been reached by the system.

ENOMEM

Not enough memory to create the kernel object.

See Also

`close()`, `epoll_ctl()`, `epoll_wait()`, `poll()`.

epoll_ctl

Name

`epoll_ctl` — control an epoll file descriptor

Synopsis

```
#include <sys/epoll.h>
int epoll_ctl(int epfd, int op, int fd, struct epoll_event * event);
```

Description

The interface `epoll_ctl()` shall control an epoll file descriptor.

The parameter *epfd* shall specify the epoll file descriptor to control.

The parameter *op* shall specify the operation to perform on the specified target file descriptor.

The parameter *fd* shall specify the target file descriptor on which to perform the specified operation.

The parameter *event* shall specify the object associated with the target file descriptor. The *events* member of the *event* parameter is a bit set composed of the event types listed below.

Event types

EPOLLERR

An error condition occurred on the target file descriptor. It shall not be necessary to set this event in *events*; this interface shall always wait for it.

EPOLLET

This event shall set edge-triggered behavior for the target file descriptor. The default epoll behavior shall be level-triggered.

EPOLLHUP

A hang up occurred on the target file descriptor. It shall not be necessary to set this event in *events*; this interface shall always wait for it.

EPOLLIN

The file is accessible to `read()` operations.

EPOLLONESHOT

This event shall set one-shot behavior for the target file descriptor. After `epoll_wait()` retrieves an event, the file descriptor shall be disabled and epoll shall not report any other events. To reenable the file descriptor with a new event mask, the user should invoke `epoll_ctl()` with `EPOLL_CTL_MOD` in the *op* parameter.

EPOLLOUT

The file is accessible to `write()` operations.

EPOLLPRI

Urgent data exists for `read()` operations.

EPOLLRDHUP

A stream socket peer closed the connection, or else the peer shut down the writing half of the connection.

Values of the `op` parameter

EPOLL_CTL_ADD

Associate *event* with the file described by *fd*, and add *fd* to the epoll descriptor *epfd*.

EPOLL_CTL_DEL

Remove *fd* from *epfd*, and ignore *event*, which can be `NULL`.

EPOLL_CTL_MOD

Change the event *event* associated with *fd*.

Return Value

On success, `epoll_ctl()` shall return 0.

On failure, `epoll_ctl()` shall return -1 and set `errno` as follows.

Errors

EBADF

The parameter *epfd* or the parameter *fd* is an invalid file descriptor.

EEXIST

The parameter *op* was `EPOLL_CTL_ADD`, but the file descriptor *fd* is already in *epfd*.

EINVAL

The parameter *epfd* is invalid, or it is the same as *fd*, or the operation specified by the parameter *op* is unsupported.

ENOENT

The parameter *op* was `EPOLL_CTL_MOD` or `EPOLL_CTL_DEL`, but the file descriptor *fd* is not in *epfd*.

ENOMEM

Not enough memory for the operation specified by the parameter *op*.

EPERM

The file specified by *fd* does not support epoll.

See Also

`close()`, `epoll_create()`, `epoll_wait()`, `poll()`.

epoll_wait

Name

`epoll_wait` — wait for I/O events on an epoll file descriptor

Synopsis

```
#include <sys/epoll.h>
int epoll_wait(int epfd, struct epoll_event * events, int maxevents,
int timeout);
```

Description

The interface `epoll_wait()` shall wait for events on the epoll file descriptor specified by the parameter *epfd*.

Upon success, the output parameter *events* shall refer to an area of memory containing `epoll_event` structures available to the caller. The *data* members of these structures shall contain the data set by the user with the interface `epoll_ctl()`. The *events* members shall contain the event bit field that was returned.

The parameter *maxevents* shall specify the maximum number of events that `epoll_wait()` may return in the output parameter *events*. The value of this parameter should be greater than 0.

The parameter *timeout* shall specify the maximum number of milliseconds that `epoll_wait()` shall wait for events. If the value of this parameter is 0, then `epoll_wait()` shall return immediately, even if no events are available, in which case the return code shall be 0. If the value of *timeout* is -1, then `epoll_wait()` shall block until either a requested event occurs or the call is interrupted.

Return Value

On success, `epoll_wait()` shall return the number of file descriptors that are ready for the I/O that was requested, or else 0 if no descriptors became ready during *timeout*.

On failure, `epoll_wait()` shall return -1 and set *errno* as follows.

Errors

EBADF

The parameter *epfd* is not a valid file descriptor.

EFAULT

The area of memory referenced by the parameter *events* cannot be accessed with write permissions.

EINTR

The call was interrupted by a signal handler before the *timeout* expired or any requested event took place.

EINVAL

The parameter *epfd* is not a valid epoll file descriptor, or else the parameter *maxevents* is less than or equal to 0.

See Also

`close()`, `epoll_ctl()`, `epoll_create()`, `poll()`.

erand48_r

Name

`erand48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int erand48_r(unsigned short[3] xsubi, struct drand48_data * buffer,
double * result);
```

Description

The interface `erand48_r()` shall function in the same way as the interface `erand48()`, except that `erand48_r()` shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling `lcong48_r()`, `seed48_r()`, or `srand48_r()`, or by filling it with zeroes.

err**Name**

`err` — display formatted error messages

Synopsis

```
#include <err.h>
void err (int eval , const char * fmt , ...);
```

Description

The `err()` function shall display a formatted error message on the standard error stream. First, `err()` shall write the last component of the program name, a colon character, and a space character. If *fmt* is non-NULL, it shall be used as a format string for the `printf()` family of functions, and `err()` shall write the formatted message, a colon character, and a space. Finally, the error message string affiliated with the current value of the global variable `errno` shall be written, followed by a newline character.

The `err()` function shall not return, the program shall terminate with the exit value of *eval*.

See Also

`error()`, `errx()`

Return Value

None.

Errors

None.

error

Name

`error` — print error message

Synopsis

```
#include <error.h>
void error (int status , int errnum , const char * format , ...);
```

Description

`error()` shall print a message to standard error.

`error()` shall build the message from the following elements in their specified order:

1. the program name. If the application has provided a function named `error_print_progname()`, `error()` shall call this to supply the program name; otherwise, `error()` uses the content of the global variable `program_name`.
2. the colon and space characters, then the result of using the printf-style *format* and the optional arguments.
3. if *errnum* is nonzero, `error()` shall add the colon and space characters, then the result of `strerror(errnum)`.
4. a newline.

If *status* is nonzero, `error()` shall call `exit(status)`.

See Also

`err()`, `errx()`

errx**Name**

`errx` — display formatted error message and exit

Synopsis

```
#include <err.h>
void errx (int eval , const char * fmt , ...);
```

Description

The `errx()` function shall display a formatted error message on the standard error stream. The last component of the program name, a colon character, and a space shall be output. If *fmt* is non-NULL, it shall be used as the format string for the `printf()` family of functions, and the formatted error message, a colon character, and a space shall be output. The output shall be followed by a newline character.

`errx()` does not return, but shall exit with the value of *eval*.

Return Value

None.

Errors

None.

See Also

`error()`, `err()`

fcntl**Name**

`fcntl` — file control

Description

`fcntl()` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Implementation may set `O_LARGEFILE`

According to POSIX 1003.1-2008 (ISO/IEC 9945-2009), only an application sets `fcntl()` flags, for example `O_LARGEFILE`. However, this specification also allows an implementation to set the `O_LARGEFILE` flag in the case where the programming environment is one of `_POSIX_V6_ILP32_OFFBIG`, `_POSIX_V6_LP64_OFF64`, `_POSIX_V6_LPBIG_OFFBIG`. See **getconf** and **c99** in POSIX 1003.1-2008 (ISO/IEC 9945-2009) for a description of these environments. Thus, calling `fcntl()` with the `F_GETFL` command may return `O_LARGEFILE` as well as flags explicitly set by the application in the case that both the implementation and the application support an `off_t` of at least 64 bits.

Additional flags

In addition to the available values for *cmd*, as documented in POSIX 1003.1-2008 (ISO/IEC 9945-2009), this specification permits the following constants.

`F_GETSIG` shall get the number of the signal to be sent when input or output can occur. If the value is 0, then `SIGIO` shall be sent. Otherwise, the value retrieved shall be the signal sent, and the signal handler can discover more information when installed with the `SA_SIGINFO` flag.

`F_SETSIG` shall set the number of the signal to be sent when input or output can occur. If the value is 0, then `SIGIO` shall be sent. Otherwise, the value set shall be the signal to be sent, and the signal handler can discover more information when installed with the `SA_SIGINFO` flag.

`F_GETLK64` is analogous to the `F_GETLK` constant in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but shall provide a 64-bit interface on non-64-bit architectures. It is identical to `F_GETLK` on a 64-bit machine, but is provided in 64-bit environments for source code consistency among architectures.

`F_SETLK64` is analogous to the `F_SETLK` constant in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but shall provide a 64-bit interface on non-64-bit architectures. It is identical to `F_SETLK` on a 64-bit machine, but is provided in 64-bit environments for source code consistency among architectures.

`F_SETLKW64` is analogous to the `F_SETLKW` constant in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but provides a 64-bit interface on non-64-bit architectures. It is identical to `F_SETLKW` on a 64-bit machine, but is provided in 64-bit environments for source code consistency among architectures.

feof_unlocked

Name

`feof_unlocked` — non-thread-safe feof

Description

`feof_unlocked()` is the same as `feof()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

ferror_unlocked

Name

`ferror_unlocked` — non-thread-safe ferror

Description

`ferror_unlocked()` is the same as `ferror()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fflush_unlocked

Name

`fflush_unlocked` — non thread safe fflush

Description

`fflush_unlocked()` is the same as `fflush()` except that it need not be thread safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fgetc_unlocked

Name

`fgetc_unlocked` — non-thread-safe fgetc

Description

`fgetc_unlocked()` is the same as `fgetc()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fgets_unlocked

Name

`fgets_unlocked` — non-thread-safe fgets

Description

`fgets_unlocked()` is the same as `fgets()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fgetwc_unlocked**Name**

`fgetwc_unlocked` — non thread safe `fgetwc`

Description

`fgetwc_unlocked()` is the same as `fgetwc()` except that it need not be thread safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fgetws_unlocked**Name**

`fgetws_unlocked` — non-thread-safe `fgetws`

Description

`fgetws_unlocked()` is the same as `fgetws()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fileno_unlocked**Name**

`fileno_unlocked` — non-thread-safe `fileno`

Description

`fileno_unlocked()` is the same as `fileno()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

flock**Name**

`flock` — apply or remove an advisory lock on an open file

Synopsis

```
int flock(int fd, int operation);
```

Description

`flock()` applies or removes an advisory lock on the open file `fd`. Valid *operation* types are:

LOCK_SH

Shared lock. More than one process may hold a shared lock for a given file at a given time.

LOCK_EX

Exclusive lock. Only one process may hold an exclusive lock for a given file at a given time.

LOCK_UN

Unlock.

LOCK_NB

Don't block when locking. May be specified (by *oring*) along with one of the other operations.

A single file may not simultaneously have both shared and exclusive locks.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors**EWOLDBLOCK**

The file is locked and the `LOCK_NB` flag was selected.

EBADF

`fd` is not a not an open file descriptor.

EINTR

While waiting to acquire a lock, the call was interrupted by delivery of a signal caught by a handler.

EINVAL

The operation is invalid.

ENOLCK

The implementation ran out of memory for allocating lock records.

fnmatch

Name

`fnmatch` — match a filename or a pathname

Description

`fnmatch()` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Additional flags

In addition to the available values that can be used to form *flags*, as documented in POSIX 1003.1-2008 (ISO/IEC 9945-2009), this specification permits the following constants.

`FNM_CASEFOLD`

If this flag is set, the pattern is matched case-insensitively.

`FNM_FILE_NAME`

A synonym for `FNM_PATHNAME` constant specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

fputc_unlocked

Name

`fputc_unlocked` — non-thread-safe `fputc`

Description

`fputc_unlocked()` is the same as `fputc()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fputs_unlocked

Name

`fputs_unlocked` — non-thread-safe `fputs`

Description

`fputs_unlocked()` is the same as `fputs()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fputwc_unlocked

Name

`fputwc_unlocked` — non-thread-safe `fputwc`

Description

`fputwc_unlocked()` is the same as `fputwc()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fputws_unlocked

Name

`fputws_unlocked` — non-thread-safe `fputws`

Description

`fputws_unlocked()` is the same as `fputws()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fread_unlocked

Name

`fread_unlocked` — non-thread-safe `fread`

Description

`fread_unlocked()` is the same as `fread()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fscanf

Name

`fscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

fstatfs

Name

`fstatfs` — (deprecated)

Synopsis

```
#include <sys/statfs.h>
int fstatfs(int fd, struct statfs * buf);
```

Description

The `fstatfs()` function returns information about a mounted file system. The file system is identified by *fd*, a file descriptor of an open file within the mounted filesystem. The results are placed in the structure pointed to by *buf*.

Fields that are undefined for a particular file system shall be set to 0.

Note: Application developers should use the `fstatvfs()` function to obtain general file system information. Applications should only use the `fstatfs()` function if they must determine the file system type, which need not be provided by `fstatvfs()`.

Return Value

On success, the `fstatfs()` function shall return 0 and set the fields of the structure identified by *buf* accordingly. On error, the `fstatfs()` function shall return -1 and set `errno` accordingly.

Errors

EBADF

fd is not a valid open file descriptor.

EFAULT

buf points to an invalid address.

EIO

An I/O error occurred while reading from or writing to the file system.

ENOSYS

The filesystem *fd* is open on does not support `statfs()`.

fstatfs64

Name

fstatfs64 — (deprecated)

Synopsis

```
#include <sys/statfs.h>
int fstatfs64(int fd, struct statfs64 * buf);
```

Description

The `fstatfs64()` function returns information about a mounted file system. The file system is identified by *fd*, a file descriptor of an open file within the mounted filesystem. The results are placed in the structure pointed to by *buf*.

Fields that are undefined for a particular file system shall be set to 0.

`fstatfs64()` is a large-file version of the `fstatfs()` function.

Note: Application developers should use the `fstatvfs64()` function to obtain general file system information. Applications should only use the `fstatfs64()` function if they must determine the file system type, which need not be provided by `fstatvfs64()`.

Return Value

On success, the `fstatfs64()` function shall return 0 and set the fields of the structure identified by *buf* accordingly. On error, the `fstatfs64()` function shall return -1 and set `errno` accordingly.

Errors

See `fstatfs()`.

futimes

Name

`futimes`, `lutimes` — set file access and modification times

Synopsis

```
#include <sys/time.h>
int futimes(int fd, const struct timeval tv[2]);
int lutimes(const char * filename, const struct timeval tv[2]);
```

Description

The `futimes()` and `lutimes()` functions shall set the access and modification times of a file to the values of the `tv` argument, which is an array of two `timeval` structures. The behavior is as for `utimes()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

The `futimes()` function shall change the times of of the open file described by file descriptor `fd`.

The `lutimes()` function shall change the times of of the file pointed to by the `filename` argument, except that if `filename` refers to a symbolic link, then the link is not followed and the times of the symbolic link are changed. This is similar to supplying `AT_SYMLINK_NOFOLLOW` in the `flag` argument to the `utimensat()` function.

Errors

As for `utimes()`, but in addition:

ENOSYS

 This implementation does not support this function (for `lutimes()`).

 The implementation could not access a resource needed to complete the function (for `futimes()`).

See Also

`utimes()`, `utime()`, `utimensat()`.

fwrite_unlocked

Name

`fwrite_unlocked` — non-thread-safe `fwrite`

Description

`fwrite_unlocked()` is the same as `fwrite()`, except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for `getc_unlocked()`.

fwscanf

Name

`fwscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

getcwd

Name

`getcwd` — get the pathname of the current working directory

Synopsis

```
#include <unistd.h>
char * getcwd(char * buf, size_t size);
```

Description

The `getcwd()` functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

If `buf` is `NULL`, memory is allocated for `buf`. If `size` is 0, the allocation size will be the size of the pathname +1, else the requested `size` is allocated.

Changed or Added Errors

`EINVAL`

The `size` argument is 0 and `buf` is not a null pointer.

`ENOENT`

The current working directory has been unlinked.

getdomainname

Name

getdomainname — get NIS domain name (DEPRECATED).

Synopsis

```
#include <unistd.h>
int getdomainname (char * name , size_t namelen );
```

Description

If the Network Information System (NIS) is in use, `getdomainname()` shall copy the NIS domain name to the supplied buffer identified by *name*, with maximum length *namelen*. If the NIS domain name is not currently set, `getdomainname()` shall copy the string "(none)" to the *name*. If *namelen* is less than the length of the string to be copied, `getdomainname()` shall either truncate the string to *namelen* characters and place it in *name* (without a terminating null character), or shall fail with EINVAL.

Note: The NIS domain name is not the same as the domain portion of a fully qualified domain name (for example, in DNS).

The LSB does not include other NIS functions, nor does it specify how NIS may affect other database functions. No conforming application can make use of this information beyond noting whether or not the domain name has been set. If the name is set to a value other than the string "(none)", the application should not imply that NIS is in use. Similarly, if it is set to "(none)", the application should not assume that NIS is not in use, although NIS functionality may be restricted in this case.

Return Value

On success, `getdomainname()` shall return 0. Otherwise, it shall return -1 and set `errno` to indicate the error.

Errors

EINVAL

name is a null pointer.

EINVAL

The buffer identified by *name* and *namelen* is of insufficient size to store the NIS domain name string, and the implementation considers this an error.

Future Directions

The LSB does not include other NIS interfaces, and a future version of this specification may remove this interface. Application developers should avoid using this interface where possible.

getdtablesize

Name

getdtablesize — get file descriptor table size (DEPRECATED)

Synopsis

```
#include <unistd.h>
int getdtablesize (void );
```

Description

The function `getdtablesize()` returns the number of files a process can have open.

Note: The `getdtablesize()` function is deprecated. Portable applications should call `sysconf()` with the `_SC_OPEN_MAX` option instead.

Return Value

The `getdtablesize()` function returns the current soft limit as if obtained by a call to `sysconf()` with the `_SC_OPEN_MAX` option.

Errors

No errors are defined.

getgrent_r

Name

getgrent_r — reentrantly get entry in group file

Synopsis

```
#include <grp.h>
int getgrent_r(struct group * gbuf, char * buf, size_t buflen, struct
group * * gbup);
```

Description

The reentrant interface `getgrent_r()` shall function in the same way as the interface `getgrent()`, except that `getgrent_r()` shall return the group name, group password, and group members in buffers provided by the caller, rather than as a pointer to static storage.

The parameter *gbuf* contains the struct group that was read from the stream, if any.

The parameter *buf* contains additional strings, if any.

The parameter *buflen* specifies the size of *buf*.

The parameter **gbup* returns a pointer to the struct group in **gbuf*.

Return Value

On success, `getgrent_r()` shall return 0, and **gbup* shall contain a pointer to the result.

On failure, **gbup* shall contain NULL, and `getgrent_r()` shall return an error as follows.

Errors

ENOENT

No more group entries.

ERANGE

Not enough buffer space. Specify a larger buffer and try again.

getgrouplist

Name

getgrouplist — get groups a user belongs to

Synopsis

```
#include <grp.h>
int getgrouplist(const char * user, gid_t group, gid_t * groups, int
* ngroups);
```

Description

The `getgrouplist()` function shall fill in the array *groups* with the supplementary groups for the user specified by *user*. On entry, *ngroups* shall refer to an integer containing the maximum number of elements in the *groups* array. The group *group* shall also be included in the values returned in *groups*. It is expected that *group* would be specified as the user's primary group from the password file (obtainable via `getpwnam()` or a similar function).

Return Value

If on entry the value referenced by *ngroups* was greater than or equal to the number of supplementary group identifiers to be copied to the array identified by *groups*, `getgrouplist()` shall return the number of group identifiers actually copied, and shall set the value referenced by *ngroups* to this value.

If on entry the value referenced by *ngroups* was less than the number of supplementary group identifiers, `getgrouplist()` shall return -1. The initial *ngroups* entries in *groups* shall be overwritten.

If the number of groups exceeds the input *ngroups* value, then as well as returning -1, *ngroups* shall be set to the number of groups that would have been placed in *groups* if it had been large enough.

Note: In such a case, the caller can use the information returned to make a further `getgrouplist()` call with a correctly sized *groups* array.

If *user* does not refer to a valid user on the system, then the behavior of this function is undefined.

Errors

None defined.

See Also

`getgroups()`

gethostbyaddr_r

Name

gethostbyaddr_r — find network host database entry matching host name
(DEPRECATED)

Synopsis

```
#include <netdb.h>
int gethostbyaddr_r(const void * restrict addr, socklen_t len, int
type, struct hostent * restrict result_buf, char * restrict buf,
size_t buflen, struct hostent * * restrict result, int * h_errnop);
```

Description

Note: The `gethostbyaddr_r()` function is deprecated; applications should use `getaddrinfo()` instead.

`gethostbyaddr_r()` is a reentrant version of `gethostbyaddr()` that searches the network host database for a host address match.

The `gethostbyaddr_r()` function shall search the network host database for an entry of address family *type* with the host with address *addr*. The *len* argument contains the length of the address referenced by *addr*.

If *type* is `AF_INET`, the *addr* argument shall be an `in_addr` structure. If *type* is `AF_INET6`, the *addr* argument shall be an `in6_addr` structure. If *type* is any other value, the behavior is unspecified.

The application must provide a buffer for the `gethostbyaddr_r()` to use during the lookup process. The buffer is referenced by *buf*, and is of size *buflen*. If the buffer is not of sufficient size, `gethostbyaddr_r()` may fail and return `ERANGE`. If a matching entry is found in the database, `gethostbyaddr_r()` shall copy the relevant information to the application supplied `hostent` structure referenced by *result_buf*, and return a pointer to this structure in **result*. If no matching entry is found, **result* shall be set to a null pointer. Additional error information shall be set in the variable referenced by *h_errnop*.

Return Value

On success, the `gethostbyaddr_r()` function shall return zero. If the return value was `ERANGE`, the size of the buffer *buf*, indicated by *buflen*, was too small. If the `gethostbyaddr_r()` function returns any other value, then the variable referenced by *h_errnop* shall be set to indicate the cause as for `gethostbyaddr()`.

gethostbyname2

Name

gethostbyname2 — find network host database entry matching host name
(DEPRECATED)

Synopsis

```
int gethostbyname2(const char * restrict name, int af);
```

Description

Note: The `gethostbyname2()` function is deprecated; applications should use `getaddrinfo()` instead.

The `gethostbyname2()` function shall search the network host database for an entry with name *name*. This function is similar to the `gethostbyname()` function but additionally allows the search to be restricted to a particular address family specified by *af*.

Return Value

On success, the `gethostbyname2()` function shall return a pointer to a `hostent` structure if the requested entry was found, and a null pointer otherwise.

On unsuccessful completion, `gethostbyname2()` shall set `h_errno` as for `gethostbyname()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Errors

The `gethostbyname2()` shall set `h_errno` as for `gethostbyname()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

gethostbyname2_r

Name

gethostbyname2_r — find network host database entry matching host name (DEPRECATED)

Synopsis

```
int gethostbyname2_r(const char * restrict name, int af, struct hostent
* restrict result_buf, char * restrict buf, size_t buflen, struct
hostent ** restrict result, int * restrict h_errnop);
```

Description

Note: The `gethostbyname2_r()` function is deprecated; applications should use `getaddrinfo()` instead.

The `gethostbyname2_r()` function shall search the network host database for an entry with name *name*. `gethostbyname2_r()` is a reentrant version of `gethostbyname2()`. These functions are similar to the `gethostbyname()` and `gethostbyname_r()` functions but additionally allow the search to be restricted to a particular address family specified by *af*.

The application must provide a buffer for the `gethostbyname2_r()` function to use during the lookup process. The buffer is referenced by *buf*, and is of size *buflen*. If the buffer is not of sufficient size, `gethostbyname_r()` may fail and return `ERANGE`. If a matching entry is found in the database, `gethostbyname_r()` shall copy the relevant information to the application-supplied `hostent` structure referenced by *result_buf*, and return a pointer to this structure in **result*. If no matching entry is found, **result* shall be set to a null pointer. Additional error information shall be set in the variable referenced by *h_errnop*.

Return Value

On success, the `gethostbyname2_r()` function shall return zero. If the return value was `ERANGE`, the size of the buffer *buf*, indicated by *buflen*, was too small. If the `gethostbyname2_r()` function returns any other value, then the variable referenced by *h_errnop* shall be set to indicate the cause as for `gethostbyname_r()`.

gethostbyname_r

Name

gethostbyname_r — find network host database entry matching host name
(DEPRECATED)

Synopsis

```
int gethostbyname_r(const char * restrict name, struct hostent *
restrict result_buf, char * restrict buf, size_t buflen, struct hostent
** restrict result, int * restrict h_errnop);
```

Description

Note: The `gethostbyname_r()` function is deprecated; applications should use `getaddrinfo()` instead.

`gethostbyname_r()` is a reentrant version of `gethostbyname()` that searches the network host database for a host name match.

The `gethostbyname_r()` function shall search the network host database for an entry with name *name*.

The application must provide a buffer for the `gethostbyname_r()` to use during the lookup process. The buffer is referenced by *buf*, and is of size *buflen*. If the buffer is not of sufficient size, `gethostbyname_r()` may fail and return `ERANGE`. If a matching entry is found in the database, `gethostbyname_r()` shall copy the relevant information to the application supplied `hostent` structure referenced by *result_buf*, and return a pointer to this structure in **result*. If no matching entry is found, **result* shall be set to a null pointer. Additional error information shall be set in the variable referenced by *h_errnop*.

Return Value

On success, the `gethostbyname_r()` function shall return zero. If the return value was `ERANGE`, the size of the buffer *buf*, indicated by *buflen*, was too small. If the `gethostbyname_r()` function returns any other value, then the variable referenced by *h_errnop* shall be set to indicate the cause as for `gethostbyname()`.

getifaddrs

Name

getifaddrs, freeifaddrs — get interface addresses

Synopsis

```
#include <ifaddrs.h>
int getifaddrs(struct ifaddrs ** ifap);
void freeifaddrs(struct ifaddrs * ifa);
```

Description

The `getifaddrs()` function creates a linked list of structures describing the network interfaces of the local system. The address of the first item is stored in memory pointed to by `ifap`. The data returned is dynamically allocated, and should be freed using `freeifaddrs()`.

The list consists of structures of type `ifaddrs` (see Data Definitions above).

Return Value

On success, `getifaddrs()` returns zero; on error, `-1` is returned, and `errno` is set appropriately.

Errors

`getifaddrs()` may fail and set `errno` for any of the errors specified for `socket()`, `bind()`, `getsockname()`, `recvmsg()`, `sendto()`, `malloc()`, or `realloc()`.

See Also

`bind()`, `getsockname()`, `socket()`.

getloadavg

Name

getloadavg — get system load averages

Synopsis

```
#include <stdlib.h>
int getloadavg(double loadavg[], int nelem);
```

Description

`getloadavg()` returns the number of processes in the system run queue averaged over various periods of time. Up to `nelem` samples are retrieved and assigned to successive elements of `loadavg[]`. The system imposes a maximum of 3 samples, representing averages over the last 1, 5, and 15 minutes, respectively.

Return Value

If the load average could not be obtained, `-1` is returned. Otherwise, the number of samples actually retrieved is returned.

getopt

Name

getopt — parse command line options

Synopsis

```
#include <unistd.h>
int getopt(int argc, char * const argv[], const char * optstring);

extern char *optarg;
```

```
extern int optind, opterr, optopt;
```

Description

The `getopt()` function shall parse command line arguments as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), with the following exceptions, where LSB and POSIX specifications vary. LSB systems shall implement the modified behaviors described below.

Argument Ordering

The `getopt()` function can process command line arguments referenced by *argv* in one of three ways:

PERMUTE

the order of arguments in *argv* is altered so that all options (and their arguments) are moved in front of all of the operands. This is the default behavior.

Note: This behavior has undefined results if *argv* is not modifiable. This is to support historic behavior predating the use of `const` and ISO C (1999). The function prototype was aligned with POSIX 1003.1-2008 (ISO/IEC 9945-2009) despite the fact that it modifies *argv*, and the library maintainers are unwilling to change this.

REQUIRE_ORDER

The arguments in *argv* are processed in exactly the order given, and option processing stops when the first non-option argument is reached, or when the element of *argv* is `--`. This ordering can be enforced either by setting the environment variable `POSIXLY_CORRECT`, or by setting the first character of *optstring* to `+`.

RETURN_IN_ORDER

The order of arguments is not altered, and all arguments are processed. Non-option arguments (operands) are handled as if they were the argument to an option with the value 1 (`\001`). This ordering is selected by setting the first character of *optstring* to `-`;

Option Characteristics

LSB specifies that:

- an element of *argv* that starts with `-` (and is not exactly `-` or `--`) is an option element.
- characters of an option element, aside from the initial `-`, are option characters.

POSIX specifies that:

- applications using `getopt()` shall obey the following syntax guidelines:
 - option name is a single alphanumeric character from the portable character set
 - option is preceded by the `-` delimiter character

- options without option-arguments should be accepted when grouped behind one '-' delimiter
- each option and option-argument is a separate argument
- option-arguments are not optional
- all options should precede operands on the command line
- the argument "--" is accepted as a delimiter indicating the end of options and the consideration of subsequent arguments, if any, as operands
- historical implementations of `getopt()` support other characters as options as an allowed extension, but applications that use extensions are not maximally portable.
- support for multi-byte option characters is only possible when such characters can be represented as type `int`.
- applications that call any utility with a first operand starting with '-' should usually specify "--" to mark the end of the options. Standard utilities that do not support this guideline indicate that fact in the OPTIONS section of the utility description.

Extensions

LSB specifies that:

- if a character is followed by two colons, the option takes an optional argument; if there is text in the current *argv* element, it is returned in *optarg*, otherwise *optarg* is set to 0.
- if *optstring* contains *W* followed by a semi-colon (;), then `-W foo` is treated as the long option `--foo`.

Note: See `getopt_long()` for a description of long options.

- The first character of *optstring* shall modify the behavior of `getopt()` as follows:
 - if the first character is '+', then `REQUIRE_ORDER` processing shall be in effect (see above)
 - if the first character is '-', then `RETURN_IN_ORDER` processing shall be in effect (see above)
 - if the first character is ':', then `getopt()` shall return ':' instead of '?' to indicate a missing option argument, and shall not print any diagnostic message to `stderr`.

POSIX specifies that:

- the `-W` option is reserved for implementation extensions.

Return Values

LSB specifies the following additional `getopt()` return values:

- '\001' is returned if `RETURN_IN_ORDER` argument ordering is in effect, and the next argument is an operand, not an option. The argument is available in *optarg*.

Any other return value has the same meaning as for *POSIX*.

POSIX specifies the following `getopt()` return values:

- the next option character is returned, if found successfully.
- '.' is returned if a parameter is missing for one of the options and the first character of `optstring` is '.'.
- '?' is returned if an unknown option character not in `optstring` is encountered, or if `getopt()` detects a missing argument and the first character of `optstring` is not '.'.
- -1 is returned for the end of the option list.

Environment Variables

LSB specifies that:

- if the variable `POSIXLY_CORRECT` is set, option processing stops as soon as a non-option argument is encountered.
- the variable `_[PID]_GNU_nonoption_argv_flags_` (where `[PID]` is the process ID for the current process), contains a space separated list of arguments that should not be treated as arguments even though they appear to be so.

Rationale: This was used by bash 2.0 to communicate to *GNU* libc which arguments resulted from wildcard expansion and so should not be considered as options. This behavior was removed in bash version 2.01, but the support remains in *GNU* libc.

This behavior is DEPRECATED in this version of the *LSB*; future revisions of this specification may not include this requirement.

getopt_long

Name

`getopt_long` — parse command line options

Synopsis

```
#define _GNU_SOURCE
#include <getopt.h>
int getopt_long(int argc, char * const argv[], const char * opstring,
const struct option * longopts, int * longindex);
```

Description

`getopt_long()` works like `getopt()` except that it also accepts long options, started out by two dashes. Long option names may be abbreviated if the abbreviation is unique or is an exact match for some defined option. A long option may take a parameter, of the form `--arg=param` or `--arg param`.

`longopts` is a pointer to the first element of an array of `struct option` declared in `getopt.h` as:

```
struct option {
    const char *name;
    int has_arg;
    int *flag;
    int val;
```

```
};
```

The fields in this structure have the following meaning:

name

The name of the long option.

has_arg

One of:

argument (or 0) if the option does not take an argument,
required_argument (or 1) if the option requires an argument, or
optional_argument (or 2) if the option takes an optional argument.

flag

specifies how results are returned for a long option. If *flag* is `NULL`, then `getopt_long()` shall return *val*. (For example, the calling program may set *val* to the equivalent short option character.) Otherwise, `getopt_long()` returns 0, and *flag* shall point to a variable which shall be set to *val* if the option is found, but left unchanged if the option is not found.

val

The value to return, or to load into the variable pointed to by *flag*.

If *longindex* is not `NULL`, it points to a variable which is set to the index of the long option relative to *longopts*.

Return Value

`getopt_long()` returns the option character if a short option was found successfully, or ":" if there was a missing parameter for one of the options, or "?" for an unknown option character, or -1 for the end of the option list.

For a long option, `getopt_long()` returns *val* if *flag* is `NULL`, and 0 otherwise. Error and -1 returns are the same as for `getopt()`, plus "?" for an ambiguous match or an extraneous parameter.

getopt_long_only

Name

`getopt_long_only` — parse command line options

Synopsis

```
#define _GNU_SOURCE
```

```
#include <getopt.h>
int getopt_long_only(int argc, char * const argv[], const char * optstring,
const struct option * longopts, int * longindex);
```

Description

`getopt_long_only()` is like `getopt_long()`, but "-" as well as "--" can indicate a long option. If an option that starts with "-" (not "--") doesn't match a long option, but does match a short option, it is parsed as a short option instead.

Note: The `getopt_long_only()` function is intended only for supporting certain programs whose command line syntax was designed before the Utility Syntax Guidelines of POSIX 1003.1-2008 (ISO/IEC 9945-2009) were developed. New programs should generally call `getopt_long()` instead, which provides the --option syntax for long options, which is preferred by GNU and consistent with POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Return Value

`getopt_long_only()` returns the option character if the option was found successfully, or ":" if there was a missing parameter for one of the options, or "?" for an unknown option character, or -1 for the end of the option list.

`getopt_long_only()` also returns the option character when a short option is recognized. For a long option, they return val if flag is NULL, and 0 otherwise. Error and -1 returns are the same as for `getopt()`, plus "?" for an ambiguous match or an extraneous parameter.

getpagesize

Name

`getpagesize` — get memory page size (DEPRECATED)

Synopsis

```
#include <unistd.h>
int getpagesize (void );
```

Description

The function `getpagesize()` returns the number of bytes in a memory page.

Note: The `getpagesize()` function is deprecated. Portable applications should use `sysconf(_SC_PAGE_SIZE)` instead.

Return Value

The `getpagesize()` function returns the current page size.

Errors

No errors are defined.

getprotobyname_r

Name

getprotobyname_r — retrieve information from the network protocol database by protocol name, reentrantly

Synopsis

```
#include <netdb.h>
int getprotobyname_r(const char * name, struct protoent * result_buf,
char * buf, size_t buflen, struct protoent ** result);
```

Description

The `getprotobyname_r()` function is a reentrant version of the `getprotobyname()` function.

The `getprotobyname_r()` function shall search the network protocol database for an entry with the name *name*.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied `protoent` structure referenced by *result_buf*, and return a pointer to this structure in **result*. If no matching entry is found, **result* shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the `protoent` structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

Return Value

On success, the `getprotobyname_r()` function shall return 0. If the return value was `ERANGE`, the size of the buffer *buf*, indicated by *buflen*, was too small.

getprotobynumber_r

Name

getprotobynumber_r — retrieve information from the network protocol database by protocol number, reentrantly

Synopsis

```
#include <netdb.h>
int getprotobynumber_r(int proto, struct protoent * result_buf, char *
buf, size_t buflen, struct protoent * * result);
```

Description

The `getprotobynumber_r()` function is a reentrant version of the `getprotobynumber()` function.

The `getprotobynumber_r()` function shall search the network protocol database for an entry with protocol number *proto*.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied `protoent` structure referenced by *result_buf*, and return a pointer to this structure in **result*. If no matching entry is found, **result* shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the `protoent` structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

Return Value

On success, the `getprotobynumber_r()` function shall return 0. If the return value was `ERANGE`, the size of the buffer *buf*, indicated by *buflen*, was too small.

getprotoent_r

Name

getprotoent_r — read the next entry of the protocol database, reentrantly

Synopsis

```
#include <netdb.h>
int getprotoent_r(struct protoent * result_buf, char * buf, size_t
buflen, struct protoent * * result);
```

Description

The `getprotoent_r()` function is a reentrant version of the `getprotoent()` function.

The `getprotoent_r()` function shall search the network protocol database for the next entry.

If the next entry is found in the database, this function shall copy the relevant information to the application-supplied `protoent` structure referenced by `result_buf`, and return a pointer to this structure in `*result`. If no next entry is found, `*result` shall be set to a null pointer.

The array `buf` shall contain the string fields referenced by the `protoent` structure that was returned. The parameter `buflen` shall specify the array's size. 1024 bytes should be enough for most uses.

Return Value

On success, the `getprotoent_r()` function shall return zero.

If the return value was `ENOENT`, there were no more entries in the database.

If the return value was `ERANGE`, the size of the buffer `buf`, indicated by `buflen`, was too small.

getpwent_r**Name**

`getpwent_r` — reentrantly get entry in passwd file

Synopsis

```
#include <pwd.h>
int getpwent_r(struct passwd * pwbuf, char * buf, size_t buflen,
struct passwd ** pwbufp);
```

Description

The reentrant interface `getpwent_r()` shall function in the same way as the interface `getpwent()`, except that `getpwent_r()` shall return the user name, user password, GECOS field, home directory, and shell program in buffers provided by the caller, rather than as a pointer to static storage.

The parameter *pwbuf* contains the struct `passwd` that was read from the stream, if any.

The parameter *buf* contains additional strings, if any.

The parameter *buflen* specifies the size of *buf*.

The parameter **pwbufp* returns a pointer to the struct `passwd` in **pwbuf*.

Return Value

On success, `getpwent_r()` shall return 0, and **pwbufp* shall contain a pointer to the result.

On failure, **pwbufp* shall contain NULL, and `getpwent_r()` shall return an error as follows.

Errors

ENOENT

No more password entries.

ERANGE

Not enough buffer space. Specify a larger buffer and try again.

getrlimit, setrlimit

Name

getrlimit, setrlimit — get resource consumption limits

Synopsis

```
#include <sys/resource.h>
int  getrlimit(__rlimit_resource_t __resource, struct rlimit *
__rlimits);
int  setrlimit(__rlimit_resource_t __resource, const struct rlimit *
__rlimits);
```

Description

getrlimit() and setrlimit() are as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Extra Resources

These additional resources extend the list in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

RLIMIT_NPROC

The maximum number of processes (or, more precisely on Linux, threads) that can be created for the real user ID of the calling process. Upon encountering this limit, `fork()` shall fail with the error EAGAIN.

RLIMIT_MEMLOCK

The maximum number of bytes of memory that may be locked into RAM. In effect this limit is rounded down to the nearest multiple of the system page size. This limit affects `mlock()` and `mlockall()`, the `mmap()` `MAP_LOCKED` operation and the `shmctl()` `SHM_LOCK` operation. The `shmctl()` `SHM_LOCK` locks are accounted for separately from the per-process memory locks established by `mlock()`, `mlockall()`, and `mmap()` `MAP_LOCKED`. In the former case, the limit sets a maximum on the total bytes in shared memory segments (see `shmget()`) that may be locked by the real user ID of the calling process. A process can lock bytes up to this limit in each of these two categories.

RLIMIT_LOCKS

A limit on the combined number of `flock()` locks and `fcntl()` leases that this process may establish. This limit is obsolete and should not be used; support depends heavily on the version of the operating system kernel.

RLIMIT_RSS

Specifies the limit (in pages) of the process's resident set. This limit is obsolete and should not be used; support depends heavily on the version of the operating system kernel. It affects only calls to `madvise()` specifying `MADV_WILLNEED`.

RLIMIT_SIGPENDING

Specifies the limit on the number of signals that may be queued for the real user ID of the calling process. Both standard and real-time signals are counted for the purpose of checking this limit. However, the limit is enforced only for `sigqueue()`; it is always possible to use `kill()` to queue one instance of any of the signals that are not already queued to the process.

RLIMIT_MSGQUEUE

Specifies the limit on the number of bytes that can be allocated for POSIX message queues for the real user ID of the calling process. This limit is enforced for `mq_open()`. Each message queue that the user creates counts (until it is removed) against this limit according to the formula:

$$\text{bytes} = \text{attr.mq_maxmsg} * \text{sizeof}(\text{struct msg_msg}) +$$

$$\text{attr.mq_maxmsg} * \text{attr.mq_msgsize}$$

where `attr` is the `mq_attr` structure specified as the fourth argument to `mq_open(3)`.

The first addend in the formula, which includes `sizeof(struct msg_msg *)` (4 bytes on Linux/i386), ensures that the user cannot create an unlimited number of zero-length messages (such messages nevertheless each consume some system memory for bookkeeping overhead).

RLIMIT_NICE

Specifies a ceiling to which the process's nice value can be raised using `setpriority()` or `nice()`. The actual ceiling for the nice value is calculated as 20 minus the value of `rlim_cur`.

RLIMIT_RTPRIO

Specifies a ceiling on the real-time priority that may be set for this process using `sched_setscheduler(2)` and `sched_setparam(2)`.

RLIMIT_RTIME

Specifies a limit (in microseconds) on the amount of CPU time that a process scheduled under a real-time scheduling policy may consume without making a blocking system call. For the purpose of this limit, each time a process makes a blocking system call, the count of its consumed CPU time is reset to zero. The CPU time count is not reset if the process continues trying to use the CPU but is preempted, its time slice expires, or it calls `sched_yield()`.

Upon reaching the soft limit, the process is sent a `SIGXCPU` signal. If the process catches or ignores this signal and continues consuming CPU time, then `SIGXCPU` will be generated once each second until the hard limit is reached, at which point the process is sent a `SIGKILL` signal.

The intended use of this limit is to stop a runaway real-time process from locking up the system.

Extra Errors

These additional error codes extend the list in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

EFAULT

A pointer argument points to a location outside the accessible address space.

getservbyname_r

Name

`getservbyname_r` — retrieve information from the network services database by service name, reentrantly

Synopsis

```
#include <netdb.h>
int getservbyname_r(const char * name, const char * proto, struct
servent * result_buf, char * buf, size_t buflen, struct servent * *
result);
```

Description

The `getservbyname_r()` function is a reentrant version of the `getservbyname()` function.

The `getservbyname_r()` function shall search the network services database for an entry with the name *name*. The *proto* parameter shall restrict the search to entries with the specified protocol. If *proto* is `NULL`, `getservbyname_r()` may return entries with any protocol.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied `servent` structure referenced by *result_buf*, and return a pointer to this structure in **result*. If no matching entry is found, **result* shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the `servent` structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

Return Value

On success, the `getservbyname_r()` function shall return zero. If the return value was `ERANGE`, the size of the buffer *buf*, indicated by *buflen*, was too small.

getservbyport_r

Name

`getservbyport_r` — retrieve information from the network services database by service port, reentrantly

Synopsis

```
#include <netdb.h>
int getservbyport_r(int port, const char * proto, struct servent *
result_buf, char * buf, size_t buflen, struct servent ** result);
```

Description

The `getservbyport_r()` function is a reentrant version of the `getservbyport()` function.

The `getservbyport_r()` function shall search the network services database for an entry with the port *port*. The *proto* parameter shall restrict the search to entries with the specified protocol. If *proto* is NULL, `getservbyport_r()` may return entries with any protocol.

If a matching entry is found in the database, this function shall copy the relevant information to the application-supplied *servent* structure referenced by *result_buf*, and return a pointer to this structure in **result*. If no matching entry is found, **result* shall be set to a null pointer.

The array *buf* shall contain the string fields referenced by the *servent* structure that was returned. The parameter *buflen* shall specify the array's size. 1024 bytes should be enough for most uses.

Return Value

On success, the `getservbyport_r()` function shall return zero. If the return value was ERANGE, the size of the buffer *buf*, indicated by *buflen*, was too small.

getservent_r

Name

`getservent_r` — read the next entry of the network services database, reentrantly

Synopsis

```
#include <netdb.h>
int getservent_r(struct servent * result_buf, char * buf, size_t buflen,
struct servent * * result);
```

Description

The `getservent_r()` function is a reentrant version of the `getservent()` function.

The `getservent_r()` function shall search the network services database for the next entry.

If the next entry is found in the database, this function shall copy the relevant information to the application-supplied `servent` structure referenced by `result_buf`, and return a pointer to this structure in `*result`. If no next entry is found, `*result` shall be set to a null pointer.

The array `buf` shall contain the string fields referenced by the `servent` structure that was returned. The parameter `buflen` shall specify the array's size. 1024 bytes should be enough for most uses.

Return Value

On success, the `getservent_r()` function shall return 0.

If the return value was `ENOENT`, there were no more entries in the database.

If the return value was `ERANGE`, the size of the buffer `buf`, indicated by `buflen`, was too small.

getsockopt

Name

`getsockopt` — get socket options

Synopsis

```
#include <sys/socket.h>
```

```
#include <netinet/ip.h>
int getsockopt(int socket, int level, int option_name, void * restrict
option_value, socklen_t * restrict option_len);
```

Description

The `getsockopt()` function shall behave as specified in *POSIX 1003.1-2008* (ISO/IEC 9945-2009), with the following extensions.

IP Protocol Level Options

If the *level* parameter is `IPPROTO_IP`, the following values shall be supported for *option_name* (see RFC 791:Internet Protocol for further details):

IP_OPTIONS

Get the Internet Protocol options sent with every packet from this socket. The *option_value* shall point to a memory buffer in which the options shall be placed; on entry *option_len* shall point to an integer value indicating the maximum size of the memory buffer, in bytes. On successful return, the value referenced by *option_len* shall be updated to the size of data copied to the buffer. For IPv4, the maximum length of options is 40 bytes.

IP_TTL

Get the current unicast Internet Protocol Time To Live value used when sending packets with this socket. The *option_value* shall point to a buffer large enough to hold the time to live value (at least 1 byte), and *option_len* shall point to an integer value holding the maximum size of that buffer. On successful return, the value referenced by *option_len* shall be updated to contain the number of bytes copied into the buffer, which shall be no larger than the initial value, and *option_value* shall point to an integer containing the time to live value.

IP_TOS

Get the Internet Protocol type of service indicator used when sending packets with this socket. The *option_value* shall point to a buffer large enough to hold the type of service indicator (at least 1 byte), and *option_len* shall point to an integer value holding the maximum size of that buffer. On successful return, the value referenced by *option_len* shall be updated to contain the number of bytes copied into the buffer, which shall be no larger than the initial value, and *option_value* shall point to an integer containing the time to live value.

gettext

Name

gettext — search message catalogs for a string

Synopsis

```
#include <libintl.h>
char * gettext(const char * msgid);
```

Description

The `gettext()` function shall search the currently selected message catalogs for a string identified by the string *msgid*. If a string is located, that string shall be returned.

The `gettext()` function is equivalent to `dcgettext(NULL, msgid, LC_MESSAGES)`.

Return Value

If a string is found in the currently selected message catalogs for *msgid*, then a pointer to that string shall be returned. Otherwise, a pointer to *msgid* shall be returned.

Applications shall not modify the string returned by `gettext()`.

Errors

None.

The `gettext()` function shall not modify `errno`.

See Also

`dgettext`, `ngettext`, `dngettext`, `dcgettext`, `dcngettext`, `textdomain`, `bindtextdomain`, `bind_textdomain_codeset`

getutent

Name

`getutent` — access user accounting database entries

Synopsis

```
#include <utmp.h>
struct utmp *getutent(void);
```

Description

The `getutent()` function shall read the next entry from the user accounting database.

Return Value

Upon successful completion, `getutent()` shall return a pointer to a `utmp` structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned. The return value may point to a static area which is overwritten by a subsequent call to `getutent()`.

Errors

None defined.

getutent_r

Name

`getutent_r` — access user accounting database entries

Synopsis

```
int getutent_r(struct utmp * buffer, struct utmp ** result);
```

Description

The `getutent_r()` function is a reentrant version of the `getutent()` function. On entry, *buffer* should point to a user supplied buffer to which the next entry in the database will be copied, and *result* should point to a location where the result will be stored.

Return Value

On success, `getutent_r()` shall return 0 and set the location referenced by *result* to a pointer to *buffer*. Otherwise, `getutent_r()` shall return -1 and set the location referenced by *result* to NULL.

getwc_unlocked

Name

getwc_unlocked — non-thread-safe getwc

Description

getwc_unlocked() is the same as getwc(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc_unlocked().

getwchar_unlocked

Name

getwchar_unlocked — non-thread-safe getwchar

Description

getwchar_unlocked() is the same as getwchar(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc_unlocked().

glob64

Name

glob64 — find pathnames matching a pattern (Large File Support)

Synopsis

```
#include <glob.h>
int glob64(const char * pattern, int flags, int (*errfunc) (const char *, int), glob64_t * pglob);
```

Description

glob64() is a large-file version of the glob() function defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It shall search for pathnames matching *pattern* according to the rules used by the shell, /bin/sh. No tilde expansion or parameter substitution is done; see wordexp().

The results of a glob64() call are stored in the structure pointed to by *pglob*, which is a glob64_t declared in glob.h with the following members:

```
typedef struct
{
    size_t gl_pathc;
    char **gl_pathv;
    size_t gl_offs;
    int gl_flags;
    void (*gl_closedir) (void *);
    struct dirent64 *(*gl_readdir64) (void *);
    void *(*gl_opendir) (const char *);
    int (*gl_lstat) (const char *, struct stat *);
    int (*gl_stat) (const char *, struct stat *);
}
```

`glob64_t;`

Structure members with the same name as corresponding members of a `glob_t` as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009) shall have the same purpose.

Other members are defined as follows:

`gl_flags`

reserved for internal use

`gl_closedir`

pointer to a function capable of closing a directory opened by `gl_opendir`

`gl_readdir64`

pointer to a function capable of reading entries in a large directory

`gl_opendir`

pointer to a function capable of opening a large directory

`gl_stat`

pointer to a function capable of returning file status for a large file

`gl_lstat`

pointer to a function capable of returning file status information for a large file or symbolic link

A large file or large directory is one with a size which cannot be represented by a variable of type `off_t`.

Return Value

On success, 0 is returned. Other possible returns are:

`GLOB_NOSPACE`

out of memory

`GLOB_ABORTED`

read error

`GLOB_NOMATCH`

no match found

globfree64

Name

`globfree64` — free memory from `glob64()` (Large File Support)

Synopsis

```
#include <glob.h>
void globfree64(glob64_t * pglob);
```

Description

`globfree64()` frees the dynamically allocated storage from an earlier call to `glob64()`.

`globfree64()` is a large-file version of the `globfree()` function defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

gnu_get_libc_version, gnu_get_libc_release

Name

gnu_get_libc_version, gnu_get_libc_release — get glibc-specific version and release

Synopsis

```
#include <gnu/libc-version.h>
const char * gnu_get_libc_version(void);
const char * gnu_get_libc_release(void);
```

Description

gnu_get_libc_version() returns a string that identifies the version of the C library running the program making the call.

gnu_get_libc_release() returns a string indicates the release status of the C library running the program making the call. This will be a string such as "stable".

Return Value

The functions return strings. The contents of these strings are unspecified.

Errors

No errors are defined.

Notes

These functions are specific to GNU libc (glibc). This specification does not require the implementation of libc to be glibc, although it requires these functions.

The string returned by gnu_get_libc_version() will be a dotted version string, which may have meaning to developers otherwise familiar with glibc. These functions have been requested to aid in portability of software which also runs in non-LSB contexts, but decisions based on the return value should be tempered by an understanding of what the behavioral requirements of this specification are. That is, it may or may not be useful to discover that a running system, for example, has version "2.10.1" if that implies different behavior than described by this specification.

hcreate_r

Name

`hcreate_r` — allocate space for a hash search table, reentrantly

Synopsis

```
#include <search.h>
int hcreate_r(size_t nel, struct hsearch_data * htab);
```

Description

The `hcreate_r()` function is a reentrant version of the `hcreate()` function.

`hcreate_r()` shall initialize the object referenced by `htab` with a hash table containing at least `nel` elements. Unlike its non-reentrant equivalent, `hcreate()`, the `hcreate_r()` function may work with more than one hash table.

The memory for the `htab` object may be dynamically allocated. It must be initialized with 0 before `hcreate_r()` is called.

Return Value

On success, `hcreate_r()` shall return a non-zero value.

On failure, `hcreate_r()` shall return 0. This usually happens because not enough memory was available.

hdestroy_r

Name

`hdestroy_r` — dispose of a hash search table, reentrantly

Synopsis

```
#include <search.h>
void hdestroy_r(struct hsearch_data * htab);
```

Description

The `hdestroy_r()` function is a reentrant version of the `hdestroy()` function.

`hdestroy_r()` frees the resources allocated by `hcreate_r()` for the object `htab`.

hsearch_r

Name

`hsearch_r` — search a hash table, reentrantly

Synopsis

```
#include <search.h>
int hsearch_r(ENTRY item, ACTION action, ENTRY * * retval, struct
hsearch_data * htab);
```

Description

The `hsearch_r()` is a reentrant version of the `hsearch()` function, but instead of operating on a single global hash table, `hsearch_r()` operates on the table described by the object that `htab` references. This object can be initialized with the function `hcreate_r()`.

Unlike the `hsearch()` function, `hsearch_r()` returns a pointer to the found entry in the variable referred to by `retval`, rather than directly.

Return Value

On success, `hsearch_r()` shall return a non-zero value.

On failure, `hsearch_r()` shall return 0 and set `errno` to an appropriate value.

Errors

ENOMEM

action was set to ENTER, but the table was full.

ESRCH

action was set to FIND, but no matching element was found in the table.

inet_aton

Name

`inet_aton` — Internet address manipulation routine

Synopsis

```
#include <sys/socket.h>
#include <netinet/in.h>
```

```
#include <arpa/inet.h>
int anet_pton(const char * cp, struct in_addr * inp);
```

Description

`inet_aton()` converts the Internet host address *cp* from the standard IPv4 numbers-and-dots notation into binary data and stores it in the structure that *inp* points to.

`inet_aton()` returns a nonzero value if the address is valid, 0 if not.

Note: Note that on some LSB architectures, the host byte order is Least Significant Byte first, whereas the network byte order, as used on the Internet, is Most Significant Byte first.

initgroups

Name

`initgroups` — initialize the supplementary group access list

Synopsis

```
#include <grp.h>
#include <sys/types.h>
int initgroups(const char * user, gid_t group);
```

Description

If the process has appropriate privilege, the `initgroups()` function shall initialize the Supplementary Group IDs for the current process by reading the group database and using all groups of which *user* is a member. The additional group *group* is also added to the list.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors

EPERM

The calling process does not have sufficient privileges.

ENOMEM

Insufficient memory to allocate group information structure.

See Also

`setgroups()`

initstate_r

Name

`initstate_r` — reentrantly initialize a state array for random number generator functions

Synopsis

```
#include <stdlib.h>
int initstate_r(unsigned int seed, char * statebuf, size_t statelen,
struct random_data * buffer);
```

Description

The interface `initstate_r()` shall function in the same way as the interface `initstate()`, except that `initstate_r()` shall use the data in *buffer* instead of the global random number generator state.

inotify_add_watch

Name

`inotify_add_watch` — add a watch to a watch list

Synopsis

```
#include <sys/inotify.h>
int inotify_add_watch(int fd, const char * path, uint32_t mask);
```

Description

`inotify_add_watch()` shall add a watch to, or modify an existing watch on, the watch list of the inotify instance specified by the file descriptor *fd*, for the file specified by *path*, to monitor the events specified by the bitmask *mask*. The caller must have read access to the file.

Return Value

On success, `inotify_add_watch()` shall return the unique, non-negative watch descriptor associated with the file *path* and the inotify instance specified by the file descriptor *fd*.

If *path* was already on the watch list, then `inotify_add_watch()` shall return the existing watch descriptor.

If *path* was not already on the watch list, then `inotify_add_watch()` shall allocate a new watch descriptor.

`inotify_add_watch()` shall not work recursively. Monitoring subdirectories of *path* shall require adding watches to them.

On failure, `inotify_add_watch()` shall return `-1` and set `errno` to an appropriate value.

Errors

EACCESS

The caller does not have read access to *path*.

EBADF

The file descriptor *fd* is invalid.

EFAULT

path is outside of the address space accessible by the process.

EINVAL

mask contains no legal events, or *fd* is not a valid inotify file descriptor.

ENOMEM

There is not enough kernel memory available.

ENOSPC

The maximum number of watches has been created for this user, or the kernel cannot allocate a resource.

Application Usage

Reading

The function `read()` can be used to determine which inotify events have occurred. A blocking file descriptor will make `read()` block until at least one event has occurred.

If successful, `read()` will return at least one of the following `inotify_event` structures in a buffer:

```
struct inotify_event {
    int      wd;
    uint32_t mask;
    uint32_t cookie;
    uint32_t len;
    char     path[];
};
```

`wd` is a watch descriptor that specifies the watch associated with the event. It is obtained from a previous invocation of `inotify_add_watch()`.

`mask` is a bit mask describing inotify events. See the section on masks below.

`cookie` is an integer associating related inotify events. The integer value is unique, and currently only enables the application to associate `IN_MOVE_FROM` and `IN_MOVE_TO` rename events.

`len` is a count of the bytes in `path`, including null bytes. This means that the total length of an `inotify_event` structure is

```
sizeof(inotify_event)+len
```

`path` is only returned when an event occurs for a file within a watched directory. This string is null-terminated, and it may contain more null bytes so that future reads will be aligned properly on an address boundary.

In kernels before 2.6.21, `read()` returns 0 when the buffer given to it is too small to return data about the next event. In subsequent kernels, it fails with the error `EINVAL`.

For a given file descriptor, the `inotify` events are returned in an ordered queue. Events on a file descriptor will always be returned in the correct order of occurrence. If two or more `inotify` events for a given file descriptor have identical values for all fields, then only one `inotify_event` will be returned to represent all of them.

The number of bytes that can be read from an `inotify` file descriptor can be determined by making a `FIONREAD` `ioctl()` call.

Masks

The `mask` argument of `inotify_add_watch()` and the `mask` field of the `inotify_event` structure are bit masks that specify `inotify` events. The bits in the list below can be set in the `mask` argument of `inotify_add_watch()` and returned in the `mask` field of `inotify_event`.

IN_ACCESS

File was read.

IN_ALL_EVENTS

Bit mask of all events in this list.

IN_ATTRIB

File's metadata changed (including timestamps and permissions).

IN_CLOSE

Same as

`IN_CLOSE_WRITE` | `IN_CLOSE_NOWRITE`

IN_CLOSE_WRITE

File that was opened for writing was closed.

IN_CLOSE_NOWRITE

File that was not opened for writing was closed.

IN_CREATE

File or directory was created in a watched directory.

IN_DELETE

File or directory was deleted in a watched directory.

IN_DELETE_SELF

Watched file or directory was deleted.

IN_MODIFY

File was changed.

IN_MOVE

Same as

IN_MOVED_FROM | IN_MOVED_TO

IN_MOVE_SELF

Watched file or directory was moved

IN_MOVED_FROM

File was moved out of watched directory.

IN_MOVED_TO

File was moved into watched directory.

IN_OPEN

File was opened.

All of the events above, except for `IN_DELETE_SELF` and `IN_MOVE_SELF`, cause the name field of the `inotify_event` structure to contain the name of the file or directory being monitored.

The following bit is valid for `inotify_add_watch()` only.

IN_ONESHOT

Monitor path for an event, and then remove it from the watch list.

The following bits are valid for the `inotify_event` structure only.

IN_IGNORED

Watch was removed, either explicitly (via `inotify_rm_watch()`) or implicitly (file deletion or file system unmounting).

IN_ISDIR

Object being watched is a directory.

IN_Q_OVERFLOW

The event queue overflowed (`wd` is set to `-1`).

IN_UNMOUNT

File system of object being watched was unmounted.

Notes

It is possible to monitor file descriptors with the functions `epoll()`, `poll()`, and `select()`.

When all of the file descriptors that point to an `inotify` instance have been closed, the instance and its associated resources and watches are freed by the kernel.

See Also

`inotify_init()`, `inotify_rm_watch()`

inotify_init

Name

inotify_init — instantiate inotify

Synopsis

```
#include <sys/inotify.h>
int inotify_init(void);
```

Description

inotify_init() shall create one instance of inotify.

Return Value

On success, inotify_init() shall return a file descriptor pointing to the new inotify instance.

On failure, inotify_init() shall return -1 and set `errno` to an appropriate value.

Errors

EMFILE

The maximum number of inotify instances has been created for this user.

ENFILE

The maximum number of file descriptors has been created on the system.

ENOMEM

There is not enough kernel memory available.

See Also

inotify_add_watch(), inotify_rm_watch()

inotify_rm_watch

Name

`inotify_rm_watch` — remove a watch from an inotify watch list

Synopsis

```
#include <sys/inotify.h>
int inotify_rm_watch(int fd, int wd);
```

Description

`inotify_rm_watch()` shall remove the watch associated with the watch descriptor `wd` from the watch list of the inotify instance associated with the file descriptor `fd`.

If a watch is removed, its watch descriptor shall generate the `IN_IGNORED` event.

Return Value

On success, `inotify_rm_watch()` shall return 0.

On failure, `inotify_rm_watch()` shall return -1 and set `errno` to an appropriate value.

Errors

EBADF

The file descriptor `fd` is invalid.

EINVAL

`wd` is invalid, or `fd` is not a valid inotify file descriptor.

See Also

`inotify_add_watch()`, `inotify_init()`

ioctl**Name**

`ioctl` — control device

Synopsis

```
#include <sys/ioctl.h>
int ioctl (int fildes , int request , ...);
```

Description

The `ioctl()` function shall manipulate the underlying device parameters of special files. *fildes* shall be an open file descriptor referring to a special file. The `ioctl()` function shall take three parameters; the type and value of the third parameter is dependent on the device and *request*.

Conforming LSB applications shall not call `ioctl()` except in situations explicitly stated in this specification.

Return Value

On success, 0 is returned. An `ioctl()` may use the return value as an output parameter and return a non-negative value on success. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors**EBADF**

fildes is not a valid descriptor.

EFAULT

The third parameter references an inaccessible memory area.

ENOTTY

fildes is not associated with a character special device.

ENOTTY

The specified request does not apply to the kind of object that *fildes* references.

EINVAL

request or the third parameter is not valid.

Relationship to POSIX (Informative)

It should be noted that POSIX 1003.1-2008 (ISO/IEC 9945-2009) contains an interface named `ioctl()`. The LSB only defines behavior when *fildes* refers to a socket (see `sockio`) or terminal device (see `ttyio`), while POSIX 1003.1-2008 (ISO/IEC 9945-2009) only defines behavior when *fildes* refers to a STREAMS device. An implementation may support both behaviors; the LSB does not require any STREAMS support.

sockio

Name

sockio — socket ioctl commands

Synopsis

```
#include <sys/ioctl.h>
#include <sys/socket.h>
#include <net/if.h>
```

```
#include <netinet/in.h>
int ioctl(int sockfd, int request, void * argp);
```

Description

Socket `ioctl()` commands are a subset of the `ioctl()` calls, which can perform a variety of functions on sockets. `sockfd` shall be an open file descriptor referring to a socket (see the `socket()` or `accept()` functions).

Socket `ioctl()` commands apply to the underlying network interfaces, and affect the entire system, not just the file descriptor used to issue the `ioctl()`.

The following values for `request` are accepted:

SIOCGIFCONF (Deprecated)

Get the interface configuration list for the system.

Note: The `SIOCGIFCONF` interface is superseded by the `if_nameindex()` family of functions (see POSIX 1003.1-2008 (ISO/IEC 9945-2009)). A future version of this specification may withdraw this value for `request`.

`argp` shall point to a `ifconf` structure, as described in `<net/if.h>`. Before calling, the caller shall set the `ifc_ifcu.ifcu_req` field to point to an array of `ifreq` structures, and set `ifc_len` to the size in bytes of this allocated array. Upon return, `ifc_len` will contain the size in bytes of the array which was actually used. If it is the same as the length upon calling, the caller should assume that the array was too small and try again with a larger array.

On success, `SIOCGIFCONF` shall return a nonnegative value.

Rationale: Historical UNIX systems disagree on the meaning of the return value.

SIOCGIFFLAGS

Get the interface flags for the indicated interface. `argp` shall point to a `ifreq` structure. Before calling, the caller should fill in the `ifr_name` field with the interface name, and upon return, the `ifr_ifru.ifru_flags` field is set with the interface flags.

SIOCGIFADDR

Get the interface address for the given interface. `argp` shall point to a `ifreq` structure. Before calling, the caller should fill in the `ifr_name` field with the interface name, and upon return, the `ifr_ifru.ifru_addr` field is set with the interface address.

SIOCGIFBRDADDR

Get the interface broadcast address for the given interface. `argp` shall point to a `ifreq` structure. Before calling, the caller should fill in the `ifr_name` field with the interface name, and upon return, the `ifr_ifru.ifru_broadcast` field is set with the interface broadcast address.

SIOCGIFDSTADDR

Get the point-to-point address for the given interface. *argp* shall point to a *ifreq* structure. Before calling, the caller should fill in the *ifr_name* field with the interface name, and upon return, the *ifr_dstaddr* field is set with the point-to-point address.

SIOCGIFNAME

Get the name of an interface. *argp* shall point to a *ifreq* structure. Before calling, the caller should fill in the *ifr_ifindex* field with the number (index) of the interface, and upon return, the *ifr_name* field is set with the interface name.

SIOCGIFNETMASK

Get the network mask for the given interface. *argp* shall point to a *ifreq* structure. Before calling, the caller should fill in the *ifr_name* field with the interface name, and upon return, the *ifr_ifru.ifru_netmask* field is set with the network mask.

SIOCGIFMTU

Get the Maximum Transmission Unit (MTU) size for the given interface. *argp* shall point to a *ifreq* structure. Before calling, the caller should fill in the *ifr_name* field with the interface name, and upon return, the *ifr_ifru.ifru_mtu* field is set with the MTU. Note: The range of valid values for MTU varies for an interface depending on the interface type.

FIONREAD

Get the amount of queued unread data in the receive buffer. *argp* shall point to an integer where the result is to be placed.

Note: Some implementations may also support the use of `FIONREAD` on other types of file descriptor. However, the LSB only specifies its behavior for a socket related file descriptor.

Return Value

On success, if *request* is `SIOCGIFCONF`, a non-negative integer shall be returned. If *request* is not `SIOCGIFCONF`, on success 0 is returned. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors

EBADF

sockfd is not a valid descriptor.

EFAULT

argp references an inaccessible memory area.

ENOTTY

The specified *request* does not apply to the kind of object that the descriptor *sockfd* references.

EINVAL

Either *request* or *argp* is invalid.

ENOTCONN

The operation is only defined on a connected socket, but the socket wasn't connected.

ttyio

Name

ttyio — tty ioctl commands

Synopsis

```
#include <sys/ioctl.h>
```

```
#include <fcntl.h>
int ioctl(int fd, unsigned long request, int * argp);
```

Description

Tty *ioctl* commands are a subset of the *ioctl()* calls, which can perform a variety of functions on tty devices. *fd* shall be an open file descriptor referring to a terminal device.

The following *ioctl()*s are provided:

TIOCGWINSZ

Get the size attributes of the terminal or pseudo-terminal identified by *fd*. On entry, *argp* shall reference a *winsize* structure. On return, the structure will have *ws_row* set to the number of rows of text (i.e. lines of text) that can be viewed on the device, and *ws_col* set to the number of columns (i.e. text width).

Note: The number of columns stored in *ws_col* assumes that the terminal device is using a mono-spaced font.

TIOCSWINSZ

Sets the size attributes of the terminal or pseudo-terminal identified by *fd*. On entry, *argp* shall reference a *winsize* structure. The value of the *winsize* structure's element *ws_row* shall be the number of rows of text (i.e. lines of text) that can be viewed on the device, and the element *ws_col* shall be the number of columns (i.e. text width). Note that this call merely sets the size attributes for the kernel driver, not the window size itself, and is intended to be used to update the kernel driver when the window size is changed.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable *errno* is set appropriately.

Errors

EBADF

fd is not a valid descriptor.

EFAULT

argp references an inaccessible memory area.

EINVAL

request and *argp* are not valid.

jrand48_r

Name

jrand48_r — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int jrand48_r(unsigned short[3] xsubi, struct drand48_data * buffer,
long int * result);
```

Description

The interface jrand48_r() shall function in the same way as the interface jrand48(), except that jrand48_r() shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling lcong48_r(), seed48_r(), or srand48_r(), or by filling it with zeroes.

kill

Name

kill — send a signal

Synopsis

```
#include <signal.h>
int kill(pid_t pid, int sig);
```

Description

kill() is as specified in the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*, but with differences as listed below.

Process ID -1 doesn't affect calling process

If *pid* is specified as -1, *sig* shall not be sent to the calling process. Other than this, the rules in the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)* apply.

Rationale: This was a deliberate Linus decision after an unpopular experiment in including the calling process in the 2.5.1 kernel. See "What does it mean to signal everybody?", Linux Weekly News, 20 December 2001, <http://lwn.net/2001/1220/kernel.php3>

lcong48_r

Name

`lcong48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int lcong48_r(unsigned short[7] param, struct drand48_data * buffer);
```

Description

The interface `lcong48_r()` shall function in the same way as the interface `lcong48()`, except that `lcong48_r()` shall use the data in *buffer* instead of the global random number generator state.

link

Name

`link` — create a link to a file

Synopsis

```
#include <unistd.h>
int link(const char * path1, const char * path2);
```

Description

The `link()` function shall behave as specified in *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*, except with differences as listed below.

Need Not Follow Symlinks

POSIX 1003.1-2008 (ISO/IEC 9945-2009) specifies that pathname resolution shall follow symbolic links during pathname resolution unless the function is required to act on the symbolic link itself, or certain arguments direct that the function act on the symbolic link itself. The `link()` function in POSIX 1003.1-2008 (ISO/IEC 9945-2009) contains no such requirement to operate on a symbolic link. However, a conforming LSB implementation need not follow a symbolic link for the *path1* argument.

lrand48_r

Name

`lrand48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int lrand48_r(struct drand48_data * buffer, long int * result);
```

Description

The interface `lrand48_r()` shall function in the same way as the interface `lrand48()`, except that `lrand48_r()` shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling `lcong48_r()`, `seed48_r()`, or `srand48_r()`, or by filling it with zeroes.

memmem

Name

`memmem` — locate bytes

Synopsis

```
#define _GNU_SOURCE
#include <string.h>
void * memmem(const void * haystack, size_t haystacklen, const void *
needle, size_t needlelen);
```

Description

`memmem()` finds the start of the first occurrence of the byte array referenced by *needle* of length *needlelen* in the memory area *haystack* of length *haystacklen*.

Return Value

If *needle* is found, `memmem()` returns a pointer to it. If *needlelen* is 0, `memmem` returns *haystack*. If *needle* is not found in *haystack*, `memmem()` returns NULL.

Notes

Earlier versions of the C library (prior to glibc 2.1) contained a `memmem()` with various problems, and application developers should treat this function with care.

memrchr

Name

`memrchr` — scan memory for a character

Synopsis

```
#include <string.h>
void * memrchr(const void * s, int c, size_t n);
```

Description

The `memrchr()` function shall locate the last occurrence of `c` (converted to an unsigned char) in the initial `n` bytes (each interpreted as an unsigned char) of the object pointed to by `s`.

Return Value

The `memrchr()` shall return a pointer to the located byte, or a null pointer if the byte does not occur in the object.

Errors

No errors are defined.

See Also

`memchr()`

mkstemp64

Name

`mkstemp64` — create a unique temporary file (Large File Support)

Synopsis

```
#include <stdio.h>
```

```
#include <stdlib.h>
int mkstemp64(char * template);
```

Description

`mkstemp64()` shall generate a unique temporary file name from *template*. The last six characters of *template* shall be `XXXXXX` and these are replaced with a string that makes the file name unique; the file is then created and an open file descriptor returned as described for `mkstemp()`.

`mkstemp64()` is a large-file version of the `mkstemp()` function as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). The only difference is that the temporary file is opened with `open64()` instead of with `open()`.

Return Value

On success, `mkstemp64()` returns the file descriptor of the temporary file. Otherwise `mkstemp64()` shall return -1 and set `errno` to indicate the error.

Errors

See `mkstemp()` for possible error values.

mrnd48_r

Name

`mrnd48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int mrnd48_r(struct drand48_data * buffer, long int * result);
```

Description

The interface `mrnd48_r()` shall function in the same way as the interface `mrnd48()`, except that `mrnd48_r()` shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling `lcong48_r()`, `seed48_r()`, or `srand48_r()`, or by filling it with zeroes.

mremap

Name

mremap — remap a virtual memory address

Synopsis

```
#include <sys/mman.h>
void * mremap(void * old_address, size_t old_size, size_t new_size,
int flags);
```

Description

The `mremap()` function expands (or shrinks) an existing memory mapping, potentially moving it at the same time, depending on the `flags` argument and the available virtual address space.

`old_address` is the old address of the virtual memory block to be resized. Note that `old_address` must be page aligned. `old_size` is the old size of the virtual memory block. `new_size` is the requested size of the virtual memory block after the resize.

In Linux the memory is divided into pages. A user process has (one or) several linear virtual memory segments. Each virtual memory segment has one or more mappings to real memory pages (in the page table). Each virtual memory segment has its own protection (access rights), which may cause a segmentation violation if the memory is accessed incorrectly (e.g., writing to a read-only segment). Accessing virtual memory outside of the segments will also cause a segmentation violation.

`mremap()` uses the Linux page table scheme. `mremap()` changes the mapping between virtual addresses and memory pages. This can be used to implement a very efficient form of `realloc()`.

The `flags` bit-mask argument may be 0, or include the following flag:

MREMAP_MAYMOVE

By default, if there is not sufficient space to expand a mapping at its current location, then `mremap()` fails. If this flag is specified, then the kernel is permitted to relocate the mapping to a new virtual address, if necessary. If the mapping is relocated, then absolute pointers into the old mapping location become invalid (offsets relative to the starting address of the mapping should be employed).

MREMAP_FIXED

This flag serves a similar purpose to the `MAP_FIXED` flag of `mmap()`. If this flag is specified, then `mremap()` accepts a fifth argument, `void *new_address`, which specifies a pagealigned address to which the mapping must be moved. Any previous mapping at the address range specified by `new_address` and `new_size` is unmapped. If `MREMAP_FIXED` is specified, then `MREMAP_MAYMOVE` must also be specified.

If the memory segment specified by `old_address` and `old_size` is locked (using `mlock()` or similar), then this lock is maintained when the segment is resized and/or relocated. As a consequence, the amount of memory locked by the process may change.

Return Value

The `mremap()` function returns a pointer to the new virtual memory area on success. On error, the value `MAP_FAILED` is returned, and `errno` is set appropriately.

Errors

EAGAIN

The caller tried to expand a memory segment that is locked, but this was not possible without exceeding the `RLIMIT_MEMLOCK` resource limit.

EFAULT

"Segmentation fault." Some address in the range `old_address` to `old_address+old_size` is an invalid virtual memory address for this process. You can also get `EFAULT` even if there exist mappings that cover the whole address space requested, but those mappings are of different types.

EINVAL

An invalid argument was given. Possible causes are: `old_address` was not page aligned; a value other than `MREMAP_MAYMOVE` or `MREMAP_FIXED` was specified in `flags`; `new_size` was zero; `new_size` or `new_address` was invalid; or the new address range specified by `new_address` and `new_size` overlapped the old address range specified by `old_address` and `old_size`; or `MREMAP_FIXED` was specified without also specifying `MREMAP_MAYMOVE`.

ENOMEM

The memory area cannot be expanded at the current virtual address, and the `MREMAP_MAYMOVE` flag is not set in `flags`, or, there is not enough (virtual) memory available.

ngettext

Name

ngettext — search message catalogs for plural string

Synopsis

```
#include <libintl.h>
char * ngettext(const char * msgid1, const char * msgid2, unsigned long
int n);
```

Description

The `ngettext()` function shall search the currently selected message catalogs for a string matching the singular string `msgid1`. If a string is located, and if `n` is 1, that string shall be returned. If `n` is not 1, a pluralized version (dependent on `n`) of the string shall be returned.

The `ngettext()` function is equivalent to `dcngettext(NULL, msgid1, msgid2, n, LC_MESSAGES)()`.

Return Value

If a string is found in the currently selected message catalogs for `msgid1`, then if `n` is 1 a pointer to the located string shall be returned. If `n` is not 1, a pointer to an appropriately pluralized version of the string shall be returned. If no message could be found in the currently selected message catalogs, then if `n` is 1, a pointer to `msgid1` shall be returned, otherwise a pointer to `msgid2` shall be returned.

Applications shall not modify the string returned by `ngettext()`.

Errors

None.

The `ngettext()` function shall not modify `errno`.

See Also

`gettext`, `dgettext`, `ngettext`, `dngettext`, `dcgettext`, `dcngettext`, `textdomain`, `bindtextdomain`, `bind_textdomain_codeset`

nrnd48_r

Name

`nrnd48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int nrnd48_r(unsigned short[3] xsubi, struct drand48_data * buffer,
long int * result);
```

Description

The interface `nrnd48_r()` shall function in the same way as the interface `nrnd48()`, except that `nrnd48_r()` shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling `lcong48_r()`, `seed48_r()`, or `srand48_r()`, or by filling it with zeroes.

openat64

Name

`openat64` — open a file relative to a directory file descriptor (Large File Support)

Synopsis

```
#include <fcntl.h>
int openat64(int fd, const char * path, int oflag, ...);
```

Description

`openat64()` shall establish a connection between a file and a file descriptor. It shall be identical `open64()` except in the case where *path* specifies a relative path. In this case, the file to be opened shall be determined relative to the directory associated with the file descriptor *fd* instead of the current working directory.

`openat64()` is a large-file version of the `openat()` function as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It differs from `openat()` in the same way that `open64()` differs from `open()`, that the open is done in large-file mode.

Return Value

On success, `openat64()` returns a new file descriptor. Otherwise `openat64()` shall return -1 and set `errno` to indicate the error.

Errors

See `openat()` for possible error values.

pmap_getport

Name

`pmap_getport` — find the port number assigned to a service registered with a portmapper.

Synopsis

```
#include <rpc/pmap_clnt.h>
u_short * pmap_getport(struct sockaddr_in * address, const u_long
program, const u_long * version, u_int protocol);
```

Description

The `pmap_getport()` function shall return the port number assigned to a service registered with a RPC Binding service running on a given target system, using the protocol described in RFC 1833: Binding Protocols for ONC RPC Version 2. The `pmap_getport()` function shall be called given the RPC program number *program*, the program version *version*, and transport protocol *protocol*. Conforming implementations shall support both `IPPROTO_UDP` and `IPPROTO_TCP` protocols. On entry, *address* shall specify the address of the system on which the portmapper to be contacted resides. The value of `address->sin_port` shall be ignored, and the standard value for the portmapper port shall always be used.

Note: Security and network restrictions may prevent a conforming application from contacting a remote RPC Binding Service.

Return Value

On success, the `pmap_getport()` function shall return the port number in host byte order of the RPC application registered with the remote portmapper. On failure, if either the program was not registered or the remote portmapper service could not be reached, the `pmap_getport()` function shall return 0. If the remote portmap service could not be reached, the status is left in the global variable `rpc_createerr`.

pmap_set

Name

`pmap_set` — establishes mapping to machine's RPC Bind service.

Synopsis

```
#include <rpc/pmap_clnt.h>
bool_t pmap_set(const u_long program, const u_long version, int protocol,
u_short port);
```

Description

`pmap_set()` establishes a mapping between the triple `[program, version, protocol]` and `port` on the machine's RPC Bind service. The value of `protocol` is most likely `IPPROTO_UDP` or `IPPROTO_TCP`. Automatically done by `svc_register()`.

Return Value

`pmap_set()` returns non-zero if it succeeds, 0 otherwise.

pmap_unset

Name

`pmap_unset` — destroys RPC Binding

Synopsis

```
#include <rpc/pmap_clnt.h>
bool_t pmap_unset(u_long prognum, u_long versnum);
```

Description

As a user interface to the RPC Bind service, `pmap_unset()` destroys all mapping between the triple `[prognum, versnum, *]` and ports on the machine's RPC Bind service.

Return Value

`pmap_unset()` returns non-zero if it succeeds, zero otherwise.

posix_fadvise64

Name

posix_fadvise64 — File advisory information (Large File Support)

Synopsis

```
#include <fcntl.h>
int posix_fadvise64(int fd, off64_t offset, off64_t len, int advice);
```

Description

The `posix_fadvise64()` function is a large-file version of the `posix_fadvise()` function defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It shall advise the implementation on the expected behavior of the application with respect to the data in the file associated with the open file descriptor, *fd*, starting at *offset* and continuing for *len* bytes. The specified range need not currently exist in the file. If *len* is zero, all data following *offset* is specified. The implementation may use this information to optimize handling of the specified data. The `posix_fadvise()` function shall have no effect on the semantics of other operations on the specified data, although it may affect the performance of other operations.

The advice to be applied to the data is specified by the *advice* parameter, as specified in `posix_fadvise()`.

Return Value

On success, `posix_fadvise64()` shall return 0. Otherwise an error number shall be returned to indicate the error. See `posix_fadvise()` for possible error values.

posix_fallocate64

Name

posix_fallocate64 — file space control (Large File Support)

Synopsis

```
#include <fcntl.h>
int posix_fallocate64(int fd, off64_t offset, off64_t len);
```

Description

The `posix_fallocate64()` function is a large file version of `posix_fallocate()`. It shall behave as `posix_fallocate()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the *offset* and *len* arguments are `off64_t` objects rather than `off_t`.

Return Value

See `posix_fallocate()`.

Errors

See `posix_fallocate()`.

pread64

Name

pread64 — read from a file (Large File Support)

Synopsis

```
#include <unistd.h>
ssize_t pread64(int fd, void * buf, size_t count, off64_t offset);
```

Description

`pread64()` shall read *count* bytes into *buf* from the file associated with the open file descriptor *fd*, at the position specified by *offset*, without changing the file position.

`pread64()` is a large-file version of the `pread()` function as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It differs from `pread()` in that the *offset* parameter is an `off64_t` instead of an `off_t`.

Return Value

On success, `pread64()` shall return the number of bytes actually read. Otherwise `pread64()` shall return -1 and set `errno` to indicate the error.

Errors

See `pread()` for possible error values.

ptrace

Name

ptrace — process trace

Synopsis

```
#include <sys/ptrace.h>
long ptrace(enum __ptrace_request request, pid_t pid, void * addr,
void * data);
```

Description

The `ptrace()` system call shall enable a process to observe and control the execution of another process, as well as examine and change certain attributes of that process.

This function operates via requests, which act on the traced process using the other parameters in ways unique to each request type. The tracing process must initiate tracing, either via the `PTRACE_TRACEME` or `PTRACE_ATTACH` requests, before other requests may be performed. Except for `PTRACE_TRACEME` and `PTRACE_KILL`, all requests must be performed on a traced process that has been stopped.

All signals, except one, delivered to the traced process cause it to stop, irrespective of its registered signal handling, and cause an event to be delivered to the tracing process which can be detected using the `wait(2)` system call. The exception is the `SIGKILL` signal, which is delivered immediately and performs its usual specified behavior.

The following requests are defined:

`PTRACE_TRACEME`

This request initiates a trace from the perspective of the traced process, indicating that the parent of the current process shall be the tracing process. When this is called, a subsequent call to `execve(2)` shall cause the tracing process to receive a `SIGTRAP` signal, and shall stop the current process. This is the only request a traced process may perform, and a tracing process may not perform this request. The other parameters are ignored.

`PTRACE_ATTACH`

This request initiates a trace from the perspective of the tracing process on the process specified by `pid`. After this call succeeds, the traced process will appear to be a child of the tracing process, although the original parent will still be returned to the traced process via `getppid(2)`. The traced process will receive a `SIGSTOP` signal; the tracing process should use `wait(2)` to ensure that the traced process has stopped. A tracing process is only guaranteed to be able to trace its child processes; the tracing of other processes may not be allowed by the system, and the process with process ID 1 may not be traced under any circumstances. The `addr` and `data` parameters are ignored.

`PTRACE_CONT`

This request restarts a traced process, given in *pid*, which has been stopped. The *data* parameter may point to a signal ID to deliver to the traced process; if it is zero or SIGSTOP, no signal is delivered to the child. The *addr* is ignored.

PTRACE_DETACH

This request performs the same function, in the same way, as PTRACE_CONT, except that the tracing relationship between the tracing and traced processes is also undone. If the trace was initiated using PTRACE_ATTACH, the original parent-child relationships that existed beforehand are restored.

PTRACE_KILL

This request causes a SIGKILL signal to be sent to the traced process specified in *pid*. The *addr* and *data* parameters are ignored.

PTRACE_PEEKTEXT

This request reads a word at the location *addr* of the traced process *pid*, and returns it to the caller. The *data* parameter is ignored.

PTRACE_PEEKDATA

This request performs identically to the PTRACE_PEEKTEXT request.

PTRACE_PEEKUSER

This request reads a word at offset *addr* in the USER area of the traced process *pid*. The offset must be word-aligned. The *data* parameter is ignored.

PTRACE_POKETEXT

This request writes the word pointed at by *data* to the location *addr* of the traced process *pid*.

PTRACE_POKEDATA

This request performs identically to the PTRACE_POKETEXT request.

PTRACE_POKEUSER

This request writes the word pointed at by *data* to offset *addr* in the USER area of the traced process *pid*. The offset must be word-aligned. Implementations may choose to disallow some modifications to the USER area.

PTRACE_GETREGS

This request copies the general purpose registers from the traced process *pid* to the tracing process at location *data*. This parameter may not be available on all architectures. The *addr* parameter is ignored.

PTRACE_GETFPREGS

This request copies the floating point registers from the traced process *pid* to the tracing process at location *data*. This parameter may not be available on all architectures. The *addr* parameter is ignored.

PTRACE_SETREGS

This request writes the general purpose registers to the traced process *pid* from the tracing process at location *data*. This parameter may not be available on all architectures. Implementations may choose to disallow some register modifications. The *addr* parameter is ignored.

PTRACE_SETFPREGS

This request writes the floating point registers to the traced process *pid* from the tracing process at location *data*. This parameter may not be available on all architectures. Implementations may choose to disallow some register modifications. The *addr* parameter is ignored.

PTRACE_GETSIGINFO

This request writes information about the signal which caused the traced process *pid* to stop to the tracing process at location *data*, as a *siginfo_t*. The *addr* parameter is ignored.

PTRACE_SETSIGINFO

This request writes signal information to the traced process *pid* from a *siginfo_t* structure pointed at by *data*, such that it will be used as the signal information by the traced process when it is resumed. The *addr* parameter is ignored.

PTRACE_GETEVENTMSG

This request stores information about the most recent ptrace event for the traced process *pid* in the unsigned long pointed at by *data*. For *PTRACE_EVENT_EXIT*, this is the exit status of the traced process. For *PTRACE_EVENT_FORK*, *PTRACE_EVENT_VFORK*, or *PTRACE_EVENT_CLONE*, this is the PID of the newly created process. The *addr* parameter is ignored.

PTRACE_SYSCALL

This request performs the same function, in the same way, as *PTRACE_CONT*, but with the additional step of causing the traced process to stop at the next entry to or exit from a system call. The usual events that would also cause the traced process to stop continue to do so.

PTRACE_SINGLESTEP

This request performs the same function, in the same way, as *PTRACE_CONT*, but with the additional step of causing the traced process to stop after execution of a single instruction. The usual events that would also cause the traced process to stop continue to do so.

PTRACE_SYSEMU

This request performs the same function, in the same way, as *PTRACE_CONT*, but with the additional step of causing the traced process to stop on entry to the next syscall, which will then not be executed.

PTRACE_SYSEMU_SINGLESTEP

This request performs the same function, in the same way, as `PTRACE_CONT`, but with the additional step of causing the traced process to stop on entry to the next syscall, which will then not be executed. If the next instruction is not itself a syscall, the traced process will stop after a single instruction is executed.

`PTRACE_SETOPTIONS`

This request sets `ptrace()` options for the traced process *pid* from the location pointed to by *data*. The *addr* is ignored. This location is interpreted as a bitmask of options, as defined by the following flags:

`PTRACE_O_TRACESYSGOOD`

This option, when set, causes syscall traps to set bit 7 in the signal number.

`PTRACE_O_TRACEFORK`

This option, when set, causes the traced process to stop when it calls `fork(2)`. The original traced process will stop with `SIGTRAP | PTRACE_EVENT_FORK << 8`, and the new process will be stopped with `SIGSTOP`. The new process will also be traced by the tracing process, as if the tracing process had sent the `PTRACE_ATTACH` request for that process. The PID of the new process may be retrieved with the `PTRACE_GETEVENTMSG` request.

`PTRACE_O_TRACEVFORK`

This option, when set, causes the traced process to stop when it calls `vfork(2)`. The original traced process will stop with `SIGTRAP | PTRACE_EVENT_VFORK << 8`, and the new process will be stopped with `SIGSTOP`. The new process will also be traced by the tracing process, as if the tracing process had sent the `PTRACE_ATTACH` request for that process. The PID of the new process may be retrieved with the `PTRACE_GETEVENTMSG` request.

`PTRACE_O_TRACECLONE`

This option, when set, causes the traced process to stop when it calls `clone(2)`. The original traced process will stop with `SIGTRAP | PTRACE_EVENT_CLONE << 8`, and the new process will be stopped with `SIGSTOP`. The new process will also be traced by the tracing process, as if the tracing process had sent the `PTRACE_ATTACH` request for that process. The PID of the new process may be retrieved with the `PTRACE_GETEVENTMSG` request. Under certain circumstances, `clone(2)` calls by the traced process will generate events and information consistent with the `PTRACE_O_TRACEVFORK` or `PTRACE_O_TRACEFORK` options above.

`PTRACE_O_TRACEEXEC`

This option, when set, causes the traced process to stop when it calls `execve(2)`. The traced process will stop with `SIGTRAP | PTRACE_EVENT_EXEC << 8`.

`PTRACE_O_TRACEVFORKDONE`

This option, when set, causes the traced process to stop at the completion of its next `vfork(2)` call. The traced process will stop with `SIGTRAP | PTRACE_EVENT_EXEC << 8`.

`PTRACE_O_TRACEEXIT`

This option, when set, causes the traced process to stop upon exit. The traced process will stop with `SIGTRAP | PTRACE_EVENT_EXIT << 8`, and its exit status can be retrieved with the `PTRACE_GETEVENTMSG` request. The stop is guaranteed to be early in the process exit process, meaning that information such as register status at exit is preserved. Upon continuing, the traced process will immediately exit.

Return Value

On success, `ptrace()` shall return the requested data for `PTRACE_PEEK` requests, or zero for all other requests. On error, all requests return -1, with `errno` set to an appropriate value. Note that -1 may be a valid return value for `PTRACE_PEEK` requests; the application is responsible for distinguishing between an error condition and a valid return value in that case.

Errors

On error, `ptrace()` shall set `errno` to one of the regular error values below:

`EBUSY`

An error occurred while allocating or freeing a debug register.

`EFAULT`

The request attempted to read from or write to an invalid area in the memory space of the tracing or traced process.

`EIO`

The request was invalid, or it attempted to read from or write to an invalid area in the memory space of the tracing or traced process, or it violated a word-alignment boundary, or an invalid signal was given to continue the traced process.

`EINVAL`

An attempt was made to set an invalid option.

`EPERM`

The request to trace a process was denied by the system.

`ESRCH`

The process requested does not exist, is not being traced by the current process, or is not stopped.

putwc_unlocked

Name

putwc_unlocked — non-thread-safe putwc

Description

putwc_unlocked() is the same as putwc(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc_unlocked().

putwchar_unlocked

Name

putwchar_unlocked — non-thread-safe putwchar

Description

putwchar_unlocked() is the same as putwchar(), except that it need not be thread-safe. That is, it may only be invoked in the ways which are legal for getc_unlocked().

pwrite64

Name

pwrite64 — write on a file (Large File Support)

Synopsis

```
#include <unistd.h>
ssize_t pwrite64(int fd, const void * buf, size_t count, off64_t offset);
```

Description

pwrite64() shall write *count* bytes from *buf* to the file associated with the open file descriptor *fd*, at the position specified by *offset*, without changing the file position.

pwrite64() is a large-file version of the pwrite() function as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009). It differs from pwrite() in that the *offset* parameter is an off64_t instead of an off_t

Return Value

On success, pwrite64() shall return the number of bytes actually written. Otherwise pwrite() shall return -1 and set *errno* to indicate the error.

Errors

See pwrite() for possible error values.

random_r

Name

`random_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int random_r(struct random_data * buffer, int32_t * result);
```

Description

The interface `random_r()` shall function in the same way as the interface `random()`, except that `random_r()` shall use the data in *buffer* instead of the global random number generator state.

Before it is used, *buffer* must be initialized, for example, by calling `lcong48_r()`, `seed48_r()`, or `srand48_r()`, or by filling it with zeroes.

readdir64_r

Name

`readdir64_r` — read a directory (Large File Support)

Synopsis

```
#include <dirent.h>
int readdir64_r(DIR * dirp, struct dirent64 * entry, struct dirent64
* * result);
```

Description

The `readdir64_r()` function is a large file version of `readdir_r()`. It shall behave as `readdir_r()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the *entry* and *result* arguments are `dirent64` structures rather than `dirent`.

Return Value

See `readdir_r()`.

Errors

See `readdir_r()`.

regexec

Name

regexec — regular expression matching

Description

The `regexec()` function shall behave as specified in *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*, except with differences as listed below.

Differences

Certain aspects of regular expression matching are optional; see Regular Expressions.

scandir64

Name

scandir64 — scan a directory (Large File Support)

Synopsis

```
#include <dirent.h>
int scandir64(const char * dir, const struct dirent64 ** namelist,
int (*sel) (const struct dirent64 *), int (*compar) (const struct
dirent64 **, const struct dirent64 **));
```

Description

`scandir64()` is a large-file version of the `scandir()` function as defined in *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*. It differs only in that the *namelist* and the parameters to the selection function *sel* and comparison function *compar* are of type `dirent64` instead of type `dirent`.

scanf

Name

`scanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

sched_getaffinity

Name

`sched_getaffinity` — retrieve the affinity mask of a process

Synopsis

```
#include <sched.h>
int sched_getaffinity(pid_t pid, unsigned int cpusetsize, cpu_set_t *
mask);
```

Description

`sched_getaffinity()` shall retrieve the affinity mask of a process.

The parameter *pid* specifies the ID for the process. If *pid* is 0, then the calling process is specified instead.

The parameter *cpusetsize* specifies the length of the data pointed to by *mask*, in bytes. Normally, this parameter is specified as `sizeof(cpu_set_t)`.

Return Value

On success, `sched_getaffinity()` shall return 0, and the structure pointed to by *mask* shall contain the affinity mask of the specified process.

On failure, `sched_getaffinity()` shall return -1 and set `errno` as follows.

Errors

EFAULT

Bad address.

EINVAL

mask does not specify any processors that exist in the system, or *cpusetsize* is smaller than the kernel's affinity mask.

ESRCH

The specified process could not be found.

See Also

`sched_setscheduler()`, `sched_setaffinity()`.

sched_setaffinity

Name

`sched_setaffinity` — set the CPU affinity mask for a process

Synopsis

```
#include <sched.h>
int sched_setaffinity(pid_t pid, unsigned int cpusetsize, cpu_set_t *
mask);
```

Description

`sched_setaffinity()` shall set the CPU affinity mask for a process.

The parameter *pid* specifies the ID for the process. If *pid* is 0, then the calling process is specified instead.

The parameter *cpusetsize* specifies the length of the data pointed to by *mask*, in bytes. Normally, this parameter is specified as `sizeof(cpu_set_t)`.

The parameter *mask* specifies the new value for the CPU affinity mask. The structure pointed to by *mask* represents the set of CPUs on which the process may run. If *mask* does not specify one of the CPUs on which the specified process is currently running, then `sched_setaffinity()` shall migrate the process to one of those CPUs.

Setting the mask on a multiprocessor system can improve performance. For example, setting the mask for one process to specify a particular CPU, and then setting the mask of all other processes to exclude the CPU, dedicates the CPU to the process so that the process runs as fast as possible. This technique also prevents loss of performance in case the process terminates on one CPU and starts again on another, invalidating cache.

Return Value

On success, `sched_setaffinity()` shall return 0.

On failure, `sched_setaffinity()` shall return -1 and set `errno` as follows.

Errors

EFAULT

Bad address.

EINVAL

mask does not specify any processors that exist in the system, or *cpusetsize* is smaller than the kernel's affinity mask.

EPERM

Insufficient privileges. The effective user ID of the process calling `sched_setaffinity()` is not equal to the user ID or effective user ID of the specified process, and the calling process does not have appropriate privileges.

ESRCH

The specified process could not be found.

See Also

`sched_setscheduler()`, `sched_getaffinity()`.

sched_setscheduler

Name

`sched_setscheduler` — set scheduling policy and parameters

Synopsis

```
#include <sched.h>
int sched_setscheduler(pid_t pid, int policy, const struct sched_param
* param);
```

Description

The `sched_setscheduler()` shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Return Value

On success, 0 is returned instead of the former scheduling policy.

seed48_r

Name

`seed48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int seed48_r(unsigned short[3] seed16v, struct drand48_data * buffer);
```

Description

The interface `seed48_r()` shall function in the same way as the interface `seed48()`, except that `seed48_r()` shall use the data in *buffer* instead of the global random number generator state.

sendfile

Name

sendfile — transfer data between two file descriptors

Synopsis

```
#include <sys/sendfile.h>
ssize_t sendfile(int out_fd, int in_fd, off_t * offset, size_t count);
```

Description

The `sendfile()` function shall copy data between the file descriptor `in_fd`, which must not be a socket, and the file descriptor `out_fd`, which must be a socket. `in_fd` should be opened for reading, and `out_fd` should be opened for writing.

The `offset` parameter points to a variable set to the file offset at which `sendfile()` shall start reading from `in_fd`, unless it is `NULL`. On exit, this variable shall contain the offset of the byte immediately after the last byte read. `sendfile()` shall not change the current file offset of `in_fd`, unless it is `NULL`. In that case, `sendfile()` shall adjust the current file offset to show how many bytes were read.

The `count` parameter specifies how many bytes to copy.

Return Value

On success, `sendfile()` shall return the number of bytes written to `out_fd`.

On failure, `sendfile()` shall return `-1` and set `errno` appropriately, as follows.

Errors

EAGAIN

Non-blocking I/O with `O_NONBLOCK` has been chosen, but the write would block.

EBADF

The input file is not open for reading, or the output file is not open for writing.

EFAULT

Bad address.

EINVAL

An `mmap()`-like operation is unavailable for `in_fd`, or file descriptor is locked or invalid.

EIO

There was an unspecified error while reading.

ENOMEM

There is not enough memory to read from `in_fd`.

Notes

`sendfile()` is usually faster than combining `read()` and `write()` calls, because it is part of the kernel. However, if it fails with `EINVAL`, falling back to `read()` and `write()` may be advisable.

It is advisable for performance reasons to use the `TCP_CORK` option of the `tcp()` function when sending header data with file contents to a TCP socket. This minimizes the number of packets.

See Also

`mmap()`, `open()`, `socket()`, `splice()`.

sendfile64

Name

`sendfile64` — transfer data between two file descriptors (Large File Support)

Synopsis

```
#include <sys/sendfile.h>
ssize_t sendfile64(int out_fd, int in_fd, off64_t * offset, size_t
count);
```

Description

The `sendfile64()` function is a large-file version of the `sendfile()` function.

setbuffer

Name

`setbuffer` — stream buffering operation

Synopsis

```
#include <stdio.h>
void setbuffer(FILE * stream, char * buf, size_t size);
```

Description

`setbuffer()` is an alias for the call to `setvbuf()`. It works the same, except that the size of the buffer in `setbuffer()` is up to the caller, rather than being determined by the default `BUFSIZ`.

setgroups

Name

`setgroups` — set list of supplementary group IDs

Synopsis

```
#include <grp.h>
int setgroups(size_t size, const gid_t * list);
```

Description

If the process has appropriate privilege, the `setgroups()` function shall set the supplementary group IDs for the current process. *list* shall reference an array of *size* group IDs. A process may have at most `NGROUPS_MAX` supplementary group IDs.

Return Value

On successful completion, 0 is returned. On error, -1 is returned and the `errno` is set to indicate the error.

Errors

EFAULT

list has an invalid address.

EPERM

The process does not have appropriate privileges.

EINVAL

size is greater than `NGROUPS_MAX`.

sethostname

Name

`sethostname` — set host name

Synopsis

```
#include <unistd.h>
#include <sys/param.h>
```

```
#include <sys/utsname.h>
int sethostname(const char * name, size_t len);
```

Description

If the process has appropriate privileges, the `sethostname()` function shall change the host name for the current machine. The `name` shall point to a null-terminated string of at most `len` bytes that holds the new hostname.

If the symbol `HOST_NAME_MAX` is defined, or if `sysconf(_SC_HOST_NAME_MAX)()` returns a value greater than 0, this value shall represent the maximum length of the new hostname. Otherwise, if the symbol `MAXHOSTLEN` is defined, this value shall represent the maximum length for the new hostname. If none of these values are defined, the maximum length shall be the size of the `nodename` field of the `utsname` structure.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable `errno` is set appropriately.

Errors

EINVAL

`len` is negative or larger than the maximum allowed size.

EPERM

the process did not have appropriate privilege.

EFAULT

`name` is an invalid address.

Rationale

POSIX 1003.1-2008 (ISO/IEC 9945-2009) guarantees that:

Maximum length of a host name (not including the terminating null) as returned from the `gethostname()` function shall be at least 255 bytes.

The glibc C library does not currently define `HOST_NAME_MAX`, and although it provides the name `_SC_HOST_NAME_MAX` a call to `sysconf()` returns -1 and does not alter `errno` in this case (indicating that there is no restriction on the hostname length). However, the glibc manual indicates that some implementations may have `MAXHOSTNAMELEN` as a means of detecting the maximum length, while the Linux kernel at release 2.4 and 2.6 stores this hostname in the `utsname` structure. While the glibc manual suggests simply shortening the name until `sethostname()` succeeds, the LSB requires that one of the first four mechanisms works. Future versions of glibc may provide a more reasonable result from `sysconf(_SC_HOST_NAME_MAX)`.

setsockopt

Name

setsockopt — set socket options

Synopsis

```
#include <sys/socket.h>
```

```
#include <netinet/ip.h>
int setsockopt(int socket, int level, int option_name, const void *
option_value, socklen_t option_len);
```

Description

The `setsockopt()` function shall behave as specified in *POSIX 1003.1-2008* (ISO/IEC 9945-2009), with the following extensions.

IP Protocol Level Options

If the *level* parameter is `IPPROTO_IP`, the following values shall be supported for *option_name* (see RFC 791:Internet Protocol for further details):

IP_OPTIONS

Set the Internet Protocol options sent with every packet from this socket. The *option_value* shall point to a memory buffer containing the options and *option_len* shall contain the size in bytes of that buffer. For IPv4, the maximum length of options is 40 bytes.

IP_TOS

Set the Type of Service flags to use when sending packets with this socket. The *option_value* shall point to a value containing the type of service value. The least significant two bits of the value shall contain the new Type of Service indicator. Use of other bits in the value is unspecified. The *option_len* parameter shall hold the size, in bytes, of the buffer referred to by *option_value*.

IP_TTL

Set the current unicast Internet Protocol Time To Live value used when sending packets with this socket. The *option_value* shall point to a value containing the time to live value, which shall be between 1 and 255. The *option_len* parameter shall hold the size, in bytes, of the buffer referred to by *option_value*.

IP_MULTICAST_TTL

Sets the Time To Live value of outgoing multicast packets for this socket. *optval* shall point to an integer which contains the new TTL value. If the new TTL value is -1, the implementation should use an unspecified default TTL value. If the new TTL value is out of the range of acceptable values (0-255), `setsockopt()` shall return -1 and set `errno` to indicate the error.

IP_MULTICAST_LOOP

Sets a boolean flag indicating whether multicast packets originating locally should be looped back to the local sockets. *optval* shall point to an integer which contains the new flag value.

IP_ADD_MEMBERSHIP

Join a multicast group. *optval* shall point to a `ip_mreq` structure. Before calling, the caller should fill in the *imr_multiaddr* field with the multicast group address and the *imr_address* field with the address of the local interface. If *imr_address* is set to `INADDR_ANY`, then an appropriate interface is chosen by the system.

IP_DROP_MEMBERSHIP

Leave a multicast group. *optval* shall point to a *ip_mreq* structure containing the same values as were used with *IP_ADD_MEMBERSHIP*.

IP_MULTICAST_IF

Set the local device for a multicast socket. *optval* shall point to either an *ip_mreqn* structure or an *in_addr* structure. If using the *ip_mreqn* structure, the *imr_multiaddr* field should be set to multicast group address, the *imr_address* field to the address of the local interface, and the *imr_index* field to the interface index. If using the *in_addr* structure, the address of the local interface shall be specified. If *in_addr* or *imr_address* is set to *INADDR_ANY*, then an appropriate interface is chosen by the system. If *imr_index* is zero, then an appropriate interface index is chosen by the implementation.

The *ip_mreq* structure contains two *struct in_addr* fields: *imr_multiaddr* and *imr_address*.

Return Value

On success, 0 is returned. On error, -1 is returned and the global variable *errno* is set appropriately.

Errors

As defined in POSIX 1003.1-2001 (ISO/IEC 9945-2003).

setstate_r

Name

setstate_r — reentrantly change the state array used by random number generator functions

Synopsis

```
#include <stdlib.h>
int setstate_r(char * statebuf, struct random_data * buf);
```

Description

The interface *setstate_r()* shall function in the same way as the interface *setstate()*, except that *setstate_r()* shall use the data in *statebuf* instead of the global random number generator state.

setutent

Name

setutent — access user accounting database entries

Synopsis

```
#include <utmp.h>
void setutent(void);
```

Description

The `setutent()` function shall reset the user accounting database such that the next call to `getutent()` shall return the first record in the database. It is recommended to call it before any of the other functions that operate on the user accounting databases (e.g. `getutent()`).

Return Value

None.

sigandset

Name

sigandset — build a new signal set by combining the two input sets using logical AND

Synopsis

```
#include <signal.h>
int sigandset(sigset_t * set, const sigset_t * left, const sigset_t *
right);
```

Description

The `sigandset()` function shall combine the two signal sets referenced by *left* and *right*, using a logical AND operation, and shall place the result in the location referenced by *set*. The resulting signal set shall contain only signals that are in both the set referenced by *left* and the set referenced by *right*.

Applications shall call `sigemptyset()` or `sigfillset()` at least once for each object of type `sigset_t` to initialize it. If an uninitialized or `NULL` object is passed to `sigandset()`, the results are undefined.

Return Value

`sigandset()` returns 0. There are no defined error returns.

See Also

`sigorset()`

sigisemptyset

Name

`sigisemptyset` — check for empty signal set

Synopsis

```
#include <signal.h>
int sigisemptyset(const sigset_t * set);
```

Description

The `sigisemptyset()` function shall check for empty signal set referenced by *set*.

Applications shall call `sigemptyset()` or `sigfillset()` at least once for each object of type `sigset_t` to initialize it. If an uninitialized or `NULL` object is passed to `sigisemptyset()`, the results are undefined.

Return Value

The `sigisemptyset()` function shall return a positive non-zero value if the signal set referenced by *set* is empty, or zero if this set is empty. There are no defined error returns.

sigorset

Name

`sigorset` — build a new signal set by combining the two input sets using logical OR

Synopsis

```
#include <signal.h>
int sigorset(sigset_t * set, const sigset_t * left, const sigset_t * right);
```

Description

The `sigorset()` function shall combine the two signal sets referenced by *left* and *right*, using a logical OR operation, and shall place the result in the location referenced by *set*. The resulting signal set shall contain only signals that are in either the set referenced by *left* or the set referenced by *right*.

Applications shall call `sigemptyset()` or `sigfillset()` at least once for each object of type `sigset_t` to initialize it. If an uninitialized or `NULL` object is passed to `sigorset()`, the results are undefined.

Return Value

`sigorset()` returns 0. There are no defined error returns.

See Also

`sigandset()`

sigpause

Name

`sigpause` — remove a signal from the signal mask and suspend the thread (deprecated)

Synopsis

```
#include <signal.h>
int sigpause(int sig);
```

Description

The `sigpause()` function is deprecated from the LSB and is expected to disappear from a future version of the LSB. Conforming applications should use `sigsuspend()` instead.

In the source standard, `sigpause()` is implemented as a macro causing it to behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), and is equivalent to the function `__xpg_sigpause()`. If the macro is undefined, `sigpause()` from the binary standard is used, with differences as described here:

The `sigpause()` function shall block those signals indicated by *sig* and suspend execution of the thread until a signal is delivered. When a signal is delivered, the original signal mask shall be restored.

See Also

`__xpg_sigpause()`

sigreturn

Name

`sigreturn` — return from signal handler and cleanup stack frame

Synopsis

```
int sigreturn(struct sigcontext * scp);
```

Description

The `sigreturn()` function is used by the system to cleanup after a signal handler has returned. This function is not in the source standard; it is only in the binary standard.

Return Value

`sigreturn()` never returns.

srand48_r**Name**

`srand48_r` — reentrantly generate pseudorandom numbers in a uniform distribution

Synopsis

```
#include <stdlib.h>
int srand48_r(long int seedval, struct drand48_data * buffer);
```

Description

The interface `srand48_r()` shall function in the same way as the interface `srand48()`, except that `srand48_r()` shall use the data in *buffer* instead of the global random number generator state.

srandom_r**Name**

`srandom_r` — reentrantly set the seed for a new sequence of pseudorandom numbers

Synopsis

```
#include <stdlib.h>
int srandom_r(unsigned int seed, struct random_data * buffer);
```

Description

The interface `srandom_r()` shall function in the same way as the interface `srandom()`, except that `srandom_r()` shall use the data in *buffer* instead of the global random number generator state.

sscanf

Name

`sscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

statfs

Name

statfs — (deprecated)

Synopsis

```
#include <sys/statfs.h>
int statfs(const char *path, struct statfs *buf);
```

Description

The `statfs()` function returns information about a mounted file system. The file system is identified by *path*, a path name of a file within the mounted filesystem. The results are placed in the structure pointed to by

Fields that are undefined for a particular file system shall be set to 0.

Note: Application developers should use the `statvfs()` function to obtain general file system information. Applications should only use the `statfs()` function if they must determine the file system type, which need not be provided by `statvfs()`.

Return Value

On success, the `statfs()` function shall return 0 and set the fields of the structure identified by *buf* accordingly. On error, the `statfs()` function shall return -1 and set `errno` accordingly.

Errors

ENOTDIR

A component of the path prefix of *path* is not a directory.

ENAMETOOLONG

path is too long.

ENOENT

The file referred to by *path* does not exist.

EACCES

Search permission is denied for a component of the path prefix of *path*.

ELOOP

Too many symbolic links were encountered in translating *path*.

EFAULT

buf or *path* points to an invalid address.

EIO

An I/O error occurred while reading from or writing to the file system.

ENOMEM

Insufficient kernel memory was available.

ENOSYS

The filesystem *path* is on does not support `statfs()`.

statfs64

Name

`statfs64` — (deprecated)

Synopsis

```
#include <sys/statfs.h>
int statfs64(const char * path, struct statfs64 *buf);
```

Description

The `statfs64()` function returns information about a mounted file system. The file system is identified by *path*, a path name of a file within the mounted filesystem. The results are placed in the structure pointed to by *buf*.

`statfs64()` is a large-file version of the `statfs()` function.

Fields that are undefined for a particular file system shall be set to 0.

Note: Application developers should use the `statvfs64()` function to obtain general file system information. Applications should only use the `statfs64()` function if they must determine the file system type, which need not be provided by `statvfs64()`.

Return Value

On success, the `statfs64()` function shall return 0 and set the fields of the structure identified by *buf* accordingly. On error, the `statfs64()` function shall return -1 and set `errno` accordingly.

Errors

See `fstatfs()`.

stime

Name

`stime` — set time

Synopsis

```
#define _SVID_SOURCE
```

```
#include <time.h>
int stime(const time_t * t);
```

Description

If the process has appropriate privilege, the `stime()` function shall set the system's idea of the time and date. Time, referenced by `t`, is measured in seconds from the epoch (defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009) as 00:00:00 UTC January 1, 1970).

Return Value

On success, `stime()` shall return 0. Otherwise, `stime()` shall return -1 and `errno` shall be set to indicate the error.

Errors

EPERM

The process does not have appropriate privilege.

EINVAL

`t` is a null pointer.

strcasestr

Name

`strcasestr` — locate a substring ignoring case

Synopsis

```
#include <string.h>
char * strcasestr(const char * s1, const char * s2);
```

Description

The `strcasestr()` shall behave as `strstr()`, except that it shall ignore the case of both strings. The `strcasestr()` function shall be locale aware; that is `strcasestr()` shall behave as if both strings had been converted to lower case in the current locale before the comparison is performed.

Return Value

Upon successful completion, `strcasestr()` shall return a pointer to the located string or a null pointer if the string is not found. If `s2` points to a string with zero length, the function shall return `s1`.

strerror_r

Name

strerror_r — return string describing error number

Synopsis

```
#include <string.h>
char * strerror_r(int errnum, char * buf, size_t buflen);
```

Description

In the source standard, `strerror_r()` is implemented as a macro causing it to behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), and is equivalent to the function `__xpg_strerror_r()`. If the macro is undefined, `strerror_r()` from the binary standard is used, with differences as described here.

The `strerror_r()` function shall return a pointer to the string corresponding to the error number *errnum*. The returned pointer may point within the buffer *buf* (at most *buflen* bytes).

Return Value

On success, `strerror_r()` shall return a pointer to the generated message string (determined by the setting of the LC_MESSAGES category in the current locale). Otherwise, `strerror_r()` shall return the string corresponding to "Unknown error".

See Also

`__xpg_strerror_r()`

strptime**Name**

`strptime` — parse a time string

Description

The `strptime()` shall behave as specified in the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)* with differences as listed below.

Number of leading zeroes may be limited

The *POSIX 1003.1-2008 (ISO/IEC 9945-2009)* specifies fields for which "leading zeros are permitted but not required"; however, applications shall not expect to be able to supply more leading zeroes for these fields than would be implied by the range of the field. Implementations may choose to either match an input with excess leading zeroes, or treat this as a non-matching input. For example, `%j` has a range of 001 to 366, so 0, 00, 000, 001, and 045 are acceptable inputs, but inputs such as 0000, 0366 and the like are not.

Rationale

glibc developers consider it appropriate behavior to forbid excess leading zeroes. When trying to parse a given input against several format strings, forbidding excess leading zeroes could be helpful. For example, if one matches 0011-12-26 against `%m-%d-%Y` and then against `%Y-%m-%d`, it seems useful for the first match to fail, as it would be perverse to parse that date as November 12, year 26. The second pattern parses it as December 26, year 11.

The *POSIX 1003.1-2008 (ISO/IEC 9945-2009)* is not explicit that an unlimited number of leading zeroes are required, although it may imply this. The LSB explicitly allows implementations to have either behavior. Future versions of this standard may require implementations to forbid excess leading zeroes.

An Interpretation Request is currently pending against *POSIX 1003.1-2008 (ISO/IEC 9945-2009)* for this matter.

strsep

Name

strsep — extract token from string

Synopsis

```
#include <string.h>
char * strsep(char * * stringp, const char * delim);
```

Description

The `strsep()` function shall find the first token in the string referenced by the pointer *stringp*, using the characters in *delim* as delimiters.

If *stringp* is NULL, `strsep()` shall return NULL and do nothing else.

If *stringp* is non-NULL, `strsep()` shall find the first token in the string referenced by *stringp*, where tokens are delimited by characters in the string *delim*. This token shall be terminated with a `\0` character by overwriting the delimiter, and *stringp* shall be updated to point past the token. In case no delimiter was found, the token is taken to be the entire string referenced by *stringp*, and the location referenced by *stringp* is made NULL.

Return Value

`strsep()` shall return a pointer to the beginning of the token.

Notes

The `strsep()` function was introduced as a replacement for `strtok()`, since the latter cannot handle empty fields. However, `strtok()` conforms to ISO C (1999) and to POSIX 1003.1-2008 (ISO/IEC 9945-2009) and hence is more portable.

See Also

`strtok()`, `strtok_r()`.

strtouq

Name

strtouq — convert string value to a long or quad_t integer

Synopsis

```
#include <sys/types.h>
#include <stdlib.h>
```

```
#include <limits.h>
long long strtouq(const char * nptr, char * * endptr, int base);
```

Description

`strtouq()` converts the string *nptr* to a quad value. The conversion is done according to the given base, which shall be between 2 and 36 inclusive, or be the special value 0.

nptr may begin with an arbitrary amount of white space (as determined by `isspace()`), followed by a single optional + or - sign character. If *base* is 0 or 16, the string may then include a 0x prefix, and the number will be read in base 16; otherwise, a 0 base is taken as 10 (decimal), unless the next character is 0, in which case it is taken as 8 (octal).

The remainder of the string is converted to a long value in the obvious manner, stopping at the first character which is not a valid digit in the given base. (In bases above 10, the letter A in either upper or lower case represents 10, B represents 11, and so forth, with Z representing 35.)

Return Value

`strtouq()` returns the result of the conversion, unless the value would underflow or overflow. If an underflow occurs, `strtouq()` returns `QUAD_MIN`. If an overflow occurs, `strtouq()` returns `QUAD_MAX`. In both cases, the global variable `errno` is set to `ERANGE`.

Errors

`ERANGE`

The given string was out of range; the value converted has been clamped.

strtouq

Name

`strtouq` — convert a string to an unsigned long long

Synopsis

```
#include <sys/types.h>
#include <stdlib.h>
```

```
#include <limits.h>
unsigned long long strtouq(const char * nptr, char * * endptr, int
base);
```

Description

`strtouq()` converts the string *nptr* to an unsigned long long value. The conversion is done according to the given base, which shall be between 2 and 36 inclusive, or be the special value 0.

nptr may begin with an arbitrary amount of white space (as determined by `isspace()`), followed by a single optional + or - sign character. If *base* is 0 or 16, the string may then include a 0x prefix, and the number will be read in base 16; otherwise, a 0 base is taken as 10 (decimal), unless the next character is 0, in which case it is taken as 8 (octal).

The remainder of the string is converted to an unsigned long value in the obvious manner, stopping at the end of the string or at the first character that does not produce a valid digit in the given base. (In bases above 10, the letter A in either upper or lower case represents 10, B represents 11, and so forth, with Z representing 35.)

Return Value

On success, `strtouq()` returns either the result of the conversion or, if there was a leading minus sign, the negation of the result of the conversion, unless the original (non-negated) value would overflow. In the case of an overflow the function returns `UQUAD_MAX` and the global variable `errno` is set to `ERANGE`.

Errors

`ERANGE`

The given string was out of range; the value converted has been clamped.

svc_register

Name

`svc_register` — register Remote Procedure Call interface

Synopsis

```
#include <rpc/rpc.h>
bool_t svc_register(SVCXPRT * xprt, rpcprog_t prognum, rpcvers_t versnum,
__dispatch_fn_t dispatch, rpcprot_t protocol);
```

Description

The `svc_register()` function shall associate the program identified by *prognum* at version *versnum* with the service dispatch procedure, *dispatch*. If *protocol* is zero, the service is not registered with the portmap service. If *protocol* is non-zero, then a mapping of the triple [*prognum*, *versnum*, *protocol*] to *xprt->xp_port* is established with the local portmap service. The procedure *dispatch* has the following form:

```
int dispatch(struct svc_req * request, SVCXPRT * xprt);
```

Return Value

`svc_register()` returns 1 if it succeeds, and zero otherwise.

svc_run

Name

`svc_run` — waits for RPC requests to arrive and calls service procedure

Synopsis

```
#include <rpc/svc.h>
void svc_run(void);
```

Description

The `svc_run()` function shall wait for RPC requests to arrive, read and unpack each request, and dispatch it to the appropriate registered handler. Under normal conditions, `svc_run()` shall not return; it shall only return if serious errors occur that prevent further processing.

svc_sendreply**Name**

`svc_sendreply` — called by RPC service's dispatch routine

Synopsis

```
bool_t svc_sendreply(SVCXPRT *xpirt, xdrproc_t outproc, caddr_t out);
```

Description

Called by an RPC service's dispatch routine to send the results of a remote procedure call. The parameter *xpirt* is the request's associated transport handle; *outproc* is the XDR routine which is used to encode the results; and *out* is the address of the results. This routine returns one if it succeeds, zero otherwise.

svctcp_create**Name**

`svctcp_create` — create a TCP/IP-based RPC service transport

Synopsis

```
#include <rpc/rpc.h>
SVCXPRT * svctcp_create(int sock, u_int send_buf_size, u_int recv_buf_size);
```

Description

`svctcp_create()` creates a TCP/IP-based RPC service transport, to which it returns a pointer. The transport is associated with the socket *sock*, which may be `RPC_ANYSOCK`, in which case a new socket is created. If the socket is not bound to a local TCP port, then this routine binds it to an arbitrary port. Upon completion, `xpirt->xp_sock` is the transport's socket descriptor, and `xpirt->xp_port` is the transport's port number. Since TCP-based RPC uses buffered I/O, users may specify the size of buffers; values of zero choose suitable defaults.

Return Value

`svctcp_create()` returns NULL if it fails, or a pointer to the RPC service transport otherwise.

svcudp_create

Name

`svcudp_create` — create a UDP-based RPC service transport

Synopsis

```
SVCXPRT *
svcudp_create(int sock);
```

Description

The `svcudp_create()` function shall create a UDP/IP-based RPC service transport, and return a pointer to its descriptor. The transport is associated with the socket `sock`, which may be `RPC_ANYSOCK`, in which case a new socket shall be created. If the socket is not bound to a local UDP port, then `svcudp_create()` shall bind it to an arbitrary port.

If `svcudp_create()` returns successfully, then the `xp_sock` field in the result shall be the transport's socket descriptor, and the `xp_port` field shall be the transport's port number.

Return Value

Upon successful completion, `svcudp_create()` shall return a pointer to a RPC service transport; otherwise, a null pointer shall be returned.

swscanf

Name

`swscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

sysconf

Name

`sysconf` — Get configuration information at runtime

Synopsis

```
#include <unistd.h>
long sysconf(int name);
```

DESCRIPTION

`sysconf()` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Extra Variables

These additional values extend the list in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

- `_SC_PHYS_PAGES`

The number of pages of physical memory.

- `_SC_AVPHYS_PAGES`

The number of currently available pages of physical memory.

- `_SC_NPROCESSORS_CONF`

The number of processors configured.

- `_SC_NPROCESSORS_ONLN`

The number of processors currently online (available).

Extra Versions

While this specification only requires conformance with POSIX 1003.1-2008 (ISO/IEC 9945-2009), implementations are not constrained from moving on and claiming conformance with a subsequent edition, POSIX 1003.1-2008 (ISO/IEC 9945-2009). Thus for run-time checks using `sysconf()`, the wording is amended to allow return values of 0, -1, 200112L or 200809L where formerly 200809L was not listed as allowed.

sysinfo

Name

`sysinfo` — return system information

Synopsis

```
#include <sys/sysinfo.h>
int sysinfo(struct sysinfo *info);
```

Description

`sysinfo()` provides a way to obtain certain system statistics. Statistics are written into a `sysinfo` structure pointed to by *info*. Elements which take a size are sized in units indicated by the value of the *mem_unit* member of *info*. The other members have traditional meanings as indicated in Data Definitions, but are not formally part of this specification.

Return Value

Returns zero on success. On error, -1 is returned and `errno` is set to indicate the error.

Errors

EFAULT

The *info* parameter does not point to a valid `sysinfo` structure.

system

Name

`system` — execute a shell command

Synopsis

```
#include <stdlib.h>
int system(const char * string);
```

Description

The `system()` function shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Notes

The fact that `system()` ignores interrupts is often not what a program wants. POSIX 1003.1-2008 (ISO/IEC 9945-2009) describes some of the consequences; an additional consequence is that a program calling `system()` from a loop cannot be reliably interrupted. Many programs will want to use the `exec()` family of functions instead.

Do not use `system()` from a program with `suid` or `sgid` privileges, because unexpected values for some environment variables might be used to subvert system integrity. Use the `exec()` family of functions instead, but not `execlp()` or `execvp()`. `system()` will not, in fact, work properly from programs with `suid` or `sgid` privileges on systems on which `/bin/sh` is **bash** version 2, since **bash** 2 drops privileges on startup. (Debian uses a modified **bash** which does not do this when invoked as **sh**.)

The check for the availability of `/bin/sh` is not actually performed; it is always assumed to be available. ISO C (1999) specifies the check, but POSIX 1003.1-2008 (ISO/IEC 9945-2009) specifies that the return shall always be nonzero, since a system without the shell is not conforming, and it is this that is implemented.

It is possible for the shell command to return 127, so that code is not a sure indication that the `execve()` call failed; check the global variable `errno` to make sure.

textdomain

Name

textdomain — set the current default message domain

Synopsis

```
#include <libintl.h>
char * textdomain(const char * domainname);
```

Description

The `textdomain()` function shall set the current default message domain to *domainname*. Subsequent calls to `gettext()` and `ngettext()` use the default message domain.

If *domainname* is `NULL`, the default message domain shall not be altered.

If *domainname* is `""`, `textdomain()` shall reset the default domain to the system default of "messages".

Return

On success, `textdomain()` shall return the currently selected domain. Otherwise, a null pointer shall be returned, and `errno` is set to indicate the error.

Errors

ENOMEM

Insufficient memory available.

unlink

Name

unlink — remove a directory entry

Synopsis

```
int unlink(const char * path);
```

Description

`unlink()` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

See also Section 18.1, Additional behaviors: unlink/link on directory.

May return EISDIR on directories

If *path* specifies a directory, the implementation may return `EISDIR` instead of `EPERM` as specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Rationale: The Linux kernel has deliberately chosen `EISDIR` for this case and does not expect to change.

utmpname

Name

utmpname — set user accounting database

Synopsis

```
#include <utmp.h>
int utmpname(const char * dbname);
```

Description

The `utmpname()` function shall cause the user accounting database used by the `getutent()`, `getutent_r()`, `getutxent()`, `getutxid()`, `getutxline()`, and `pututxline()` functions to be that named by *dbname*, instead of the system default database. See Section 18.3 for further information.

Note: The LSB does not specify the format of the user accounting database, nor the names of the file or files that may contain it.

Return Value

None.

Errors

None defined.

vasprintf

Name

vasprintf — write formatted output to a dynamically allocated string

Synopsis

```
#include <stdarg.h>
#include <stdio.h>
int vasprintf(char * * restrict ptr, const char * restrict format,
va_list arg);
```

Description

The `vasprintf()` function shall write formatted output to a dynamically allocated string, and store the address of that string in the location referenced by *ptr*. It shall behave as `asprintf()`, except that instead of being called with a variable number of arguments, it is called with an argument list as defined by `<stdarg.h>`.

Return Value

Refer to `fprintf()`.

Errors

Refer to `fprintf()`.

verrx**Name**

`verrx` — display formatted error message and exit

Synopsis

```
#include <stdarg.h>
#include <err.h>
void verrx (int eval , const char * fmt , va_list args );
```

Description

The `verrx()` shall behave as `errx()` except that instead of being called with a variable number of arguments, it is called with an argument list as defined by `<stdarg.h>`.

`verrx()` does not return, but exits with the value of `eval`.

Return Value

None.

Errors

None.

vfscanf**Name**

`vfscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

vfwscanf**Name**

`vfwscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

vscanf**Name**

`vscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

vsscanf**Name**

`vsscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

vswscanf**Name**

`vswscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

vsyslog

Name

`vsyslog` — log to system log

Synopsis

```
#include <stdarg.h>
#include <syslog.h>
void vsyslog(int priority, char * message, va_list arglist);
```

Description

The `vsyslog()` function is identical to `syslog()` as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that *arglist* (as defined by `stdarg.h`) replaces the variable number of arguments.

vwscanf

Name

`vwscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

wait4

Name

`wait4` — wait for process termination, BSD style

Synopsis

```
#include <sys/types.h>
#include <sys/resource.h>
```

```
#include <sys/wait.h>
pid_t wait4(pid_t pid, int * status, int options, struct rusage * rusage);
```

Description

`wait4()` suspends execution of the current process until a child (as specified by `pid`) has exited, or until a signal is delivered whose action is to terminate the current process or to call a signal handling function. If a child (as requested by `pid`) has already exited by the time of the call (a so-called "zombie" process), the function returns immediately. Any system resources used by the child are freed.

The value of `pid` can be one of:

< -1

wait for any child process whose process group ID is equal to the absolute value of `pid`.

-1

wait for any child process; this is equivalent to calling `wait3()`.

0

wait for any child process whose process group ID is equal to that of the calling process.

> 0

wait for the child whose process ID is equal to the value of `pid`.

The value of `options` is a bitwise or of zero or more of the following constants:

WNOHANG

return immediately if no child is there to be waited for.

WUNTRACED

return for children that are stopped, and whose status has not been reported.

If `status` is not NULL, `wait4()` stores status information in the location `status`. This status can be evaluated with the following macros:

Note: These macros take the `status` value (an `int`) as an argument -- not a pointer to the value!

WIFEXITED(`status`)

is nonzero if the child exited normally.

WEXITSTATUS(`status`)

evaluates to the least significant eight bits of the return code of the child that terminated, which may have been set as the argument to a call to `exit()` or as the argument for a return statement in the main program. This macro can only be evaluated if `WIFEXITED()` returned nonzero.

WIFSIGNALED(`status`)

returns true if the child process exited because of a signal that was not caught.

WTERMSIG(status)

returns the number of the signal that caused the child process to terminate.
This macro can only be evaluated if WIFSIGNALED() returned nonzero.

WIFSTOPPED(status)

returns true if the child process that caused the return is currently stopped;
this is only possible if the call was done using WUNTRACED().

WSTOPSIG(status)

returns the number of the signal that caused the child to stop. This macro can
only be evaluated if WIFSTOPPED() returned nonzero.

If *rusage* is not NULL, the struct *rusage* (as defined in *sys/resource.h*) that it
points to will be filled with accounting information. See *getrusage()* for details.

Return Value

On success, the process ID of the child that exited is returned. On error, -1 is
returned (in particular, when no unwaited-for child processes of the specified
kind exist), or 0 if WNOHANG() was used and no child was available yet. In the
latter two cases, the global variable *errno* is set appropriately.

Errors

ECHILD

No unwaited-for child process as specified does exist.

ERESTARTSYS

A WNOHANG() was not set and an unblocked signal or a SIGCHLD was caught.
This error is returned by the system call. The library interface is not allowed
to return ERESTARTSYS, but will return EINTR.

warn**Name**

`warn` — formatted error messages

Synopsis

```
#include <err.h>
void warn (const char * fmt , ...);
```

Description

The `warn()` function shall display a formatted error message on the standard error stream. The output shall consist of the last component of the program name, a colon character, and a space character. If *fmt* is non-NULL, it shall be used as a format string for the `printf()` family of functions, and the formatted message, a colon character, and a space are written to `stderr`. Finally, the error message string affiliated with the current value of the global variable `errno` shall be written to `stderr`, followed by a newline character.

Return Value

None.

Errors

None.

warnx**Name**

`warnx` — formatted error messages

Synopsis

```
#include <err.h>
void warnx (const char * fmt , ...);
```

Description

The `warnx()` function shall display a formatted error message on the standard error stream. The last component of the program name, a colon character, and a space shall be output. If *fmt* is non-NULL, it shall be used as the format string for the `printf()` family of functions, and the formatted error message, a colon character, and a space shall be output. The output shall be followed by a newline character.

Return Value

None.

Errors

None.

wcstoq**Name**

`wcstoq` — convert wide string to long long int representation

Synopsis

```
#include <wchar.h>
long long int wcstoq(const wchar_t * restrict nptr, wchar_t **
restrict endptr, int base);
```

Description

The `wcstoq()` function shall convert the initial portion of the wide string *nptr* to long long int representation. It is identical to `wcstoll()`.

Return Value

Refer to `wcstoll()`.

Errors

Refer to `wcstoll()`.

wcstouq**Name**

`wcstouq` — convert wide string to unsigned long long int representation

Synopsis

```
#include <wchar.h>
unsigned long long wcstouq(const wchar_t * restrict nptr, wchar_t **
restrict endptr, int base);
```

Description

The `wcstouq()` function shall convert the initial portion of the wide string *nptr* to unsigned long long int representation. It is identical to `wcstoull()`.

Return Value

Refer to `wcstoull()`.

Errors

Refer to `wcstoull()`.

wscanf**Name**

`wscanf` — convert formatted input

Description

The `scanf()` family of functions shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except as noted below.

Differences

The `%s`, `%S` and `%[` conversion specifiers shall accept an option length modifier `a`, which shall cause a memory buffer to be allocated to hold the string converted. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. If there is insufficient memory to allocate a buffer, the function may set `errno` to `ENOMEM` and a conversion error results.

Note: This directly conflicts with the ISO C (1999) usage of `%a` as a conversion specifier for hexadecimal float values. While this conversion specifier should be supported, a format specifier such as `"%aseconds"` will have a different meaning on an LSB conforming system.

xdr_u_int**Name**

`xdr_u_int` — library routines for external data representation

Synopsis

```
int xdr_u_int(XDR * xdrs, unsigned int * up);
```

Description

`xdr_u_int()` is a filter primitive that translates between C unsigned integers and their external representations.

Return Value

On success, 1 is returned. On error, 0 is returned.

xdrstdio_create

Name

xdrstdio_create — library routines for external data representation

Synopsis

```
#include <rpc/xdr.h>
void xdrstdio_create(XDR * xdrs, FILE * file, enum xdr_op op);
```

Description

The `xdrstdio_create()` function shall initialize the XDR stream object referred to by `xdrs`. The XDR stream data shall be written to, or read from, the standard I/O stream associated with `file`. If the operation `op` is `XDR_ENCODE`, encoded data shall be written to `file`. If `op` is `XDR_DECODE`, encoded data shall be read from `file`. If `op` is `XDR_FREE`, the XDR stream object may be used to deallocate storage allocated by a previous `XDR_DECODE`.

The associated destroy function shall flush the `file` I/O stream, but not close it.

Return Value

None.

14.6 Interfaces for libm

Table 14-38 defines the library name and shared object name for the libm library

Table 14-38 libm Definition

Library:	libm
SONAME:	See architecture specific part.

The behavior of the interfaces in this library is specified by the following specifications:

- [LSB] This Specification
- [SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)
- [SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

14.6.1 Math

14.6.1.1 Interfaces for Math

An LSB conforming implementation shall provide the generic functions for Math specified in Table 14-39, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-39 libm - Math Function Interfaces

__finite [LSB]	__finitef [LSB]	__finitel [LSB]	__fpclassify [LSB]

14.7 Data Definitions for libm

This section defines global identifiers and their values that are associated with interfaces contained in libm. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

14.8 Interface Definitions for libm

The interfaces defined on the following pages are included in libm and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 14.6 shall behave as described in the referenced base document.

__finite

Name

`__finite` — test for infinity

Synopsis

```

#include <math.h>
int __finite(double arg);

```

Description

`__finite()` has the same specification as `isfinite()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__finite()` is known to be double.

`__finite()` is not in the source standard; it is only in the binary standard.

__finitef**Name**

`__finitef` — test for infinity

Synopsis

```
#include <math.h>
int __finitef(float arg);
```

Description

`__finitef()` has the same specification as `isfinite()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009) except that the argument type for `__finitef()` is known to be float.

`__finitef()` is not in the source standard; it is only in the binary standard.

__finitel**Name**

`__finitel` — test for infinity

Synopsis

```
#include <math.h>
int __finitel(long double arg);
```

Description

`__finitel()` has the same specification as `isfinite()` in the POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__finitel()` is known to be long double.

`__finitel()` is not in the source standard; it is only in the binary standard.

__fpclassify**Name**

`__fpclassify` — Classify real floating type

Synopsis

```
int __fpclassify(double arg);
```

Description

`__fpclassify()` has the same specification as `fpclassify()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__fpclassify()` is known to be double.

`__fpclassify()` is not in the source standard; it is only in the binary standard.

__fpclassifyf

Name

`__fpclassifyf` — Classify real floating type

Synopsis

```
int __fpclassifyf(float arg);
```

Description

`__fpclassifyf()` has the same specification as `fpclassify()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__fpclassifyf()` is known to be float.

`__fpclassifyf()` is not in the source standard; it is only in the binary standard.

__signbit

Name

`__signbit` — test sign of floating point value

Synopsis

```
#include <math.h>
int __signbit(double arg);
```

Description

`__signbit()` has the same specification as `signbit()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__signbit()` is known to be double.

`__signbit()` is not in the source standard; it is only in the binary standard.

__signbitf

Name

`__signbitf` — test sign of floating point value

Synopsis

```
#include <math.h>
int __signbitf(float arg);
```

Description

`__signbitf()` has the same specification as `signbit()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that the argument type for `__signbitf()` is known to be float.

`__signbitf()` is not in the source standard; it is only in the binary standard.

clog10**Name**

`clog10` — Logarithm of a Complex Number

Synopsis

```
#include <complex.h>
double complex clog10(double complex z);
```

Description

The `clog10()` function shall compute the base 10 logarithm of the complex number z .

Return Value

The `clog10()` function shall return the base 10 logarithm.

clog10f**Name**

`clog10f` — Logarithm of a Complex Number

Synopsis

```
#include <complex.h>
float complex clog10f(float complex z);
```

Description

The `clog10f()` function shall compute the base 10 logarithm of the complex number z .

Return Value

The `clog10f()` function shall return the base 10 logarithm.

clog10l**Name**

`clog10l` — Logarithm of a Complex Number

Synopsis

```
#include <complex.h>
long double complex clog10l(long double complex z);
```

Description

The `clog10l()` function shall compute the base 10 logarithm of the complex number z .

Return Value

The `clog10l()` function shall return the base 10 logarithm.

drem

Name

drem — Floating Point Remainder (DEPRECATED)

Synopsis

```
#include <math.h>
double drem(double x, double y);
```

Description

The `drem()` function shall return the floating point remainder, $x \text{ REM } y$ as required by IEC 60559/IEEE 754 Floating Point in the same way as `remainder()`.

Note: This function is included only for backwards compatibility; applications should use `remainder()` instead.

Returns

See `remainder()`.

See Also

`remainder()`, `dremf()`, `dreml()`

dremf

Name

dremf — Floating Point Remainder (DEPRECATED)

Synopsis

```
#include <math.h>
double dremf(double x, double y);
```

Description

The `dremf()` function shall return the floating point remainder, $x \text{ REM } y$ as required by IEC 60559/IEEE 754 Floating Point in the same way as `remainderf()`.

Note: This function is included only for backwards compatibility; applications should use `remainderf()` instead.

Returns

See `remainderf()`.

See Also

`remainderf()`, `drem()`, `dreml()`

drem1**Name**

drem1 — Floating Point Remainder (DEPRECATED)

Synopsis

```
#include <math.h>
double drem1(double x, double y);
```

Description

The `drem1()` function shall return the floating point remainder, $x \text{ REM } y$ as required by IEC 60559/IEEE 754 Floating Point in the same way as `remainder1()`.

Note: This function is included only for backwards compatibility; applications should use `remainder1()` instead.

Returns

See `remainder1()`.

See Also

`remainder1()`, `drem()`, `dremf()`

exp10**Name**

exp10 — Base-10 power function

Synopsis

```
#include <math.h>
double exp10(double x);
```

Description

The `exp10()` function shall return 10^x .

Note: This function is identical to `pow10()`.

Returns

Upon successful completion, `exp10()` shall return 10 raised to the power of x .

If the correct value would cause overflow, a range error shall occur and `exp10()` shall return $\pm\text{HUGE_VAL}$, with the same sign as the correct value of the function.

See Also

`pow10()`, `exp10f()`, `exp10l()`

exp10f**Name**

exp10f — Base-10 power function

Synopsis

```
#include <math.h>
float exp10f(float x);
```

Description

The `exp10f()` function shall return 10^x .

Note: This function is identical to `pow10f()`.

Returns

Upon successful completion, `exp10f()` shall return 10 raised to the power of x .

If the correct value would cause overflow, a range error shall occur and `exp10f()` shall return $\pm\text{HUGE_VALF}$, with the same sign as the correct value of the function.

See Also

`pow10f()`, `exp10()`, `exp10l()`

exp10l**Name**

exp10l — Base-10 power function

Synopsis

```
#include <math.h>
long double exp10l(long double x);
```

Description

The `exp10l()` function shall return 10^x .

Note: This function is identical to `pow10l()`.

Returns

Upon successful completion, `exp10l()` shall return 10 raised to the power of x .

If the correct value would cause overflow, a range error shall occur and `exp10l()` shall return $\pm\text{HUGE_VALL}$, with the same sign as the correct value of the function.

See Also

`pow10l()`, `exp10()`, `exp10f()`

fedisableexcept**Name**

`fedisableexcept` — disable floating point exceptions

Synopsis

```
#include <fenv.h>
int fedisableexcept(int excepts);
```

Description

The `fedisableexcept()` function disables traps for each of the exceptions represented by the mask `excepts`.

Return Value

The `fedisableexcept()` function returns the previous set of enabled exceptions on success. On error, -1 is returned.

Errors

No errors are defined, but the function will fail if not supported on the architecture.

feenableexcept**Name**

`feenableexcept` — enable floating point exceptions

Synopsis

```
#include <fenv.h>
int feenableexcept(int excepts);
```

Description

The `feenableexcept()` function enables traps for each of the exceptions represented by the mask `excepts`.

Return Value

The `feenableexcept()` function returns the previous set of enabled exceptions on success. On error, -1 is returned.

Errors

No errors are defined, but the function will fail if not supported on the architecture.

fegetexcept

Name

`fegetexcept` — query floating point exception handling state

Synopsis

```
#include <fenv.h>
int fegetexcept(void);
```

Description

The `fegetexcept()` function returns the set of all currently enabled exceptions.

Return Value

The `fegetexcept()` function returns the set of all currently enabled exceptions.

Errors

No errors are defined, but the function will fail if not supported on the architecture.

finite

Name

`finite` — test for infinity (DEPRECATED)

Synopsis

```
#define _SVID_SOURCE
#include <math.h>
int finite(double arg);
```

Description

The `finite()` function shall test whether its argument is neither `INFINITY` nor not a number (NaN).

Returns

On success, `finite()` shall return 1. Otherwise the function shall return 0.

Note: The ISO C (1999) standard defines the function `isfinite()`, which is more general purpose. The `finite()` function is deprecated, and applications should use `isfinite()` instead. A future revision of this standard may remove this function.

See Also

`isfinite()`, `finitef()`, `finitel()`

finitef

Name

`finitef` — test for infinity (DEPRECATED)

Synopsis

```
#define _SVID_SOURCE
#include <math.h>
int finitef(float arg);
```

Description

The `finitef()` function shall test whether its argument is neither `INFINITY` nor not a number (NaN).

Returns

On success, `finitef()` shall return 1. Otherwise the function shall return 0.

Note: The ISO C (1999) standard defines the function `isfinite()`, which is more general purpose. The `finitef()` function is deprecated, and applications should use `isfinite()` instead. A future revision of this standard may remove this function.

See Also

`isfinite()`, `finite()`, `finitel()`

finitel

Name

`finitel` — test for infinity (DEPRECATED)

Synopsis

```
#define _SVID_SOURCE
#include <math.h>
int finitel(long double arg);
```

Description

The `finitel()` function shall test whether its argument is neither `INFINITY` nor not a number (NaN).

Returns

On success, `finitel()` shall return 1. Otherwise the function shall return 0.

Note: The ISO C (1999) standard defines the function `isfinite()`, which is more general purpose. The `finitel()` function is deprecated, and applications should use `isfinite()` instead. A future revision of this standard may remove this function.

See Also

`isfinite()`, `finite()`, `finitef()`

gamma

Name

gamma — log gamma function (DEPRECATED)

Synopsis

```
#include <math.h>
double gammaf(double x);
```

Description

The `gamma()` function is identical to `lgamma()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Note: The name `gamma()` for this function is deprecated and should not be used.

Returns

See `lgamma()`.

See Also

`lgamma()`, `lgammaf()`, `lgammal()`, `gammaf()`, `gammal()`

gammaf

Name

gammaf — log gamma function (DEPRECATED)

Synopsis

```
#include <math.h>
float gammaf(float x);
```

Description

The `gammaf()` function is identical to `lgammaf()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Note: The name `gammaf()` for this function is deprecated and should not be used.

Returns

See `lgammaf()`.

See Also

`lgamma()`, `lgammaf()`, `lgammal()`, `gamma()`, `gammal()`

gammal

Name

`gammal` — log gamma function (DEPRECATED)

Synopsis

```
#include <math.h>
long double gammal(long double x);
```

Description

The `gammal()` function is identical to `lgammal()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Note: The name `gammal()` for this function is deprecated and should not be used.

Returns

See `lgammal()`.

See Also

`lgamma()`, `lgammaf()`, `lgammal()`, `gamma()`, `gammaf()`

j0f

Name

`j0f` — Bessel functions

Synopsis

```
#include <math.h>
float j0f(float x);
```

Description

The `j0f()` function is identical to `j0()`, except that the argument `x` and the return value is a float.

Returns

See `j0()`.

See Also

`j0()`, `j0l()`, `j1()`, `j1f()`, `j1l()`, `jn()`, `jnf()`, `jnl()`, `y0()`, `y0f()`, `y0l()`, `y1()`, `y1f()`, `y1l()`, `yn()`, `ynf()`, `ynl()`

j0l**Name**

j0l — Bessel functions

Synopsis

```
#include <math.h>
long double j0l(long double x);
```

Description

The j0l() function is identical to j0(), except that the argument *x* and the return value is a long double.

Returns

See j0().

See Also

j0(), j0f(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(), y1f(), y1l(), yn(), ynf(), ynl()

j1f**Name**

j1f — Bessel functions

Synopsis

```
#include <math.h>
float j1f(float x);
```

Description

The j1f() function is identical to j1(), except that the argument *x* and the return value is a float.

Returns

See j1().

See Also

j0(), j0f(), j0l(), j1(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(), y1f(), y1l(), yn(), ynf(), ynl()

j1l**Name**

j1l — Bessel functions

Synopsis

```
#include <math.h>
long double j1l(long double x);
```

Description

The j1l() function is identical to j1(), except that the argument *x* and the return value is a long double.

Returns

See j0().

See Also

j0(), j0f(), j0l(), j1(), j1f(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(), y1f(), y1l(), yn(), ynf(), ynl()

jnf**Name**

jnf — Bessel functions

Synopsis

```
#include <math.h>
float jnf(float x);
```

Description

The jnf() function is identical to jn(), except that the argument *x* and the return value is a float.

Returns

See jn().

See Also

j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnl(), y0(), y0f(), y0l(), y1(), y1f(), y1l(), yn(), ynf(), ynl()

jnl**Name**

jnl — Bessel functions

Synopsis

```
#include <math.h>
long double jnl(long double x);
```

Description

The `jnl()` function is identical to `jn()`, except that the argument `x` and the return value is a long double.

Returns

See `jn()`.

See Also

`j0()`, `j0f()`, `j0l()`, `j1()`, `j1f()`, `j1l()`, `jn()`, `jnf()`, `y0()`, `y0f()`, `y0l()`, `y1()`, `y1f()`, `y1l()`, `yn()`, `ynf()`, `ynl()`

lgamma_r**Name**

lgamma_r — log gamma functions

Synopsis

```
#include <math.h>
double lgamma_r(double x, int * signp);
```

Description

The `lgamma_r()` function shall compute the natural logarithm of the absolute value of the Gamma function, as `lgamma()`. However, instead of setting the external integer `signgam` to the sign of the Gamma function, `lgamma_r()` shall set the integer referenced by `signp` to the sign.

Returns

See `lgamma()` and `signgam`.

See Also

`lgamma()`, `lgammaf_r()`, `lgammal_r()`, `signgam`

lgammaf_r

Name

lgammaf_r — log gamma functions

Synopsis

```
#include <math.h>
float lgammaf_r(float x, int * signp);
```

Description

The `lgammaf_r()` function shall compute the natural logarithm of the absolute value of the Gamma function, as `lgammaf()`. However, instead of setting the external integer `signgam` to the sign of the Gamma function, `lgammaf_r()` shall set the integer referenced by `signp` to the sign.

Returns

See `lgammaf()` and `signgam`.

See Also

`lgamma()`, `lgamma_r()`, `lgammal_r()`, `signgam`

lgammal_r

Name

lgammal_r — log gamma functions

Synopsis

```
#include <math.h>
double lgammal_r(double x, int * signp);
```

Description

The `lgammal_r()` function shall compute the natural logarithm of the absolute value of the Gamma function, as `lgammal()`. However, instead of setting the external integer `signgam` to the sign of the Gamma function, `lgammal_r()` shall set the integer referenced by `signp` to the sign.

Returns

See `lgammal()` and `signgam`.

See Also

`lgamma()`, `lgamma_r()`, `lgammaf_r()`, `signgam`

matherr

Name

`matherr` — math library exception handling

Synopsis

```
#include <math.h>
int matherr(struct exception *__exc);
```

Description

The System V Interface Definition (SVID) Issue 3 specifies that various math functions should invoke a function called `matherr()` if a math exception is detected. This function is called before the math function returns; after `matherr()` returns, the system then returns to the math function, which in turn returns to the caller.

`matherr()` is obsolete; indeed it was withdrawn in the System V Interface Definition (SVID) Issue 4, and is required only by this specification for historical compatibility, and will be removed in a future version. The floating point environment function group including `fesetenv()` should be used instead.

`matherr()` is not in the source standard; it is only in the binary standard.

See Also

`fesetenv()`, `fegetenv()`, `feupdateenv()`.

pow10

Name

`pow10` — Base-10 power function

Synopsis

```
#include <math.h>
double pow10(double x);
```

Description

The `pow10()` function shall return 10^x .

Note: This function is identical to `exp10()`.

Returns

Upon successful completion, `pow10()` shall return 10 raised to the power of x .

If the correct value would cause overflow, a range error shall occur and `pow10()` shall return $\pm\text{HUGE_VAL}$, with the same sign as the correct value of the function.

See Also

`exp10()`, `pow10f()`, `pow10l()`

pow10f**Name**

pow10f — Base-10 power function

Synopsis

```
#include <math.h>
float pow10f(float x);
```

Description

The `pow10f()` function shall return 10^x .

Note: This function is identical to `exp10f()`.

Returns

Upon successful completion, `pow10f()` shall return 10 raised to the power of x .

If the correct value would cause overflow, a range error shall occur and `pow10f()` shall return $\pm\text{HUGE_VALF}$, with the same sign as the correct value of the function.

See Also

`exp10f()`, `pow10()`, `pow10l()`

pow10l**Name**

pow10l — Base-10 power function

Synopsis

```
#include <math.h>
long double pow10l(long double x);
```

Description

The `pow10l()` function shall return 10^x .

Note: This function is identical to `exp10l()`.

Returns

Upon successful completion, `pow10l()` shall return 10 raised to the power of x .

If the correct value would cause overflow, a range error shall occur and `pow10l()` shall return $\pm\text{HUGE_VALL}$, with the same sign as the correct value of the function.

See Also

`exp10l()`, `pow10()`, `pow10f()`

scalbf

Name

scalbf — load exponent of radix-independent floating point number

Synopsis

```
#include <math.h>
float scalbf(float x, double exp);
```

Description

The `scalbf()` function is identical to `scalb()`, except that the argument `x` and the return value is of type `float`.

Returns

See `scalb()`.

scalbl

Name

scalbl — load exponent of radix-independent floating point number

Synopsis

```
#include <math.h>
long double scalbl(long double x, double exp);
```

Description

The `scalbl()` function is identical to `scalb()`, except that the argument `x` and the return value is of type `long double`.

Returns

See `scalb()`.

significand

Name

significand — floating point mantissa

Synopsis

```
#include <math.h>
double significand(double x);
```

Description

The `significand()` function shall return the mantissa of x , sig such that $x \equiv \text{sig} \times 2^n$ scaled such that $1 \leq \text{sig} < 2$.

Note: This function is intended for testing conformance to IEC 60559/IEEE 754 Floating Point, and its use is not otherwise recommended.

This function is equivalent to `scalb(x, (double)-ilogb(x))`.

Returns

Upon successful completion, `significand()` shall return the mantissa of x in the range $1 \leq \text{sig} < 2$.

If x is 0, $\pm\text{HUGE_VAL}$, or NaN, the result is undefined.

See Also

`significandf()`, `significandl()`

significandf

Name

significandf — floating point mantissa

Synopsis

```
#include <math.h>
float significandf(float x);
```

Description

The `significandf()` function shall return the mantissa of x , sig such that $x \equiv sig \times 2^n$ scaled such that $1 \leq sig < 2$.

Note: This function is intended for testing conformance to IEC 60559/IEEE 754 Floating Point, and its use is not otherwise recommended.

This function is equivalent to `scalb(x, (double)-ilogb(x))`.

Returns

Upon successful completion, `significandf()` shall return the mantissa of x in the range $1 \leq sig < 2$.

If x is 0, `±HUGE_VALF`, or NaN, the result is undefined.

See Also

`significand()`, `significandl()`

significandl

Name

significandl — floating point mantissa

Synopsis

```
#include <math.h>
long double significandl(long double x);
```

Description

The `significandl()` function shall return the mantissa of x , sig such that $x \equiv sig \times 2^n$ scaled such that $1 \leq sig < 2$.

Note: This function is intended for testing conformance to IEC 60559/IEEE 754 Floating Point, and its use is not otherwise recommended.

This function is equivalent to `scalb(x, (double)-ilogb(x))`.

Returns

Upon successful completion, `significandl()` shall return the mantissa of x in the range $1 \leq sig < 2$.

If x is 0, `±HUGE_VALL`, or NaN, the result is undefined.

See Also

`significand()`, `significandf()`

sincos

Name

sincos — trigonometric functions

Synopsis

```
#define _GNU_SOURCE
#include <math.h>
void sincos(double x, double * sin, double * cos);
```

Description

The `sincos()` function shall calculate both the sine and cosine of x . The sine shall be stored in the location referenced by `sin`, and the cosine in the location referenced by `cosine`.

Returns

None. See `sin()` and `cos()` for possible error conditions.

See Also

`cos()`, `sin()`, `sincosf()`, `sincosl()`

sincosf

Name

sincosf — trigonometric functions

Synopsis

```
#define _GNU_SOURCE
#include <math.h>
void sincosf(float x, float * sin, float * cos);
```

Description

The `sincosf()` function shall calculate both the sine and cosine of x . The sine shall be stored in the location referenced by `sin`, and the cosine in the location referenced by `cosine`.

Returns

None. See `sin()` and `cos()` for possible error conditions.

See Also

`cos()`, `sin()`, `sincos()`, `sincosl()`

sincosl

Name

sincosl — trigonometric functions

Synopsis

```
#define _GNU_SOURCE
#include <math.h>
void sincosl(long double x, long double * sin, long double * cos);
```

Description

The `sincosl()` function shall calculate both the sine and cosine of x . The sine shall be stored in the location referenced by `sin`, and the cosine in the location referenced by `cosine`.

Returns

None. See `sin()` and `cos()` for possible error conditions.

See Also

`cos()`, `sin()`, `sincos()`, `sincosl()`

y0f**Name**

y0f — Bessel functions

Synopsis

```
#include <math.h>
float y0f(float x);
```

Description

The y0f() function is identical to y0(), except that the argument *x* and the return value is a float.

Returns

See y0().

See Also

j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0l(), y1(), y1f(), y1l(), yn(), ynf(), ynl()

y0l**Name**

y0l — Bessel functions

Synopsis

```
#include <math.h>
long double y0l(long double x);
```

Description

The y0l() function is identical to y0(), except that the argument *x* and the return value is a long double.

Returns

See y0().

See Also

j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y1(), y1f(), y1l(), yn(), ynf(), ynl()

y1f**Name**

y1f — Bessel functions

Synopsis

```
#include <math.h>
float y1f(float x);
```

Description

The y1f() function is identical to y1(), except that the argument *x* and the return value is a float.

Returns

See y1().

See Also

j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(), y1l(), yn(), ynf(), ynl()

y1l**Name**

y1l — Bessel functions

Synopsis

```
#include <math.h>
long double y1l(long double x);
```

Description

The y1l() function is identical to y1(), except that the argument *x* and the return value is a long double.

Returns

See j0().

See Also

j0(), j0f(), j0l(), j1(), j1f(), j1l(), jn(), jnf(), jnl(), y0(), y0f(), y0l(), y1(), y1f(), yn(), ynf(), ynl()

ynf**Name**

ynf — Bessel functions

Synopsis

```
#include <math.h>
float ynf(float x);
```

Description

The `ynf()` function is identical to `yn()`, except that the argument `x` and the return value is a float.

Returns

See `yn()`.

See Also

`j0()`, `j0f()`, `j0l()`, `j1()`, `j1f()`, `j1l()`, `jn()`, `jnf()`, `jnl()`, `y0()`, `y0f()`, `y0l()`, `y1()`, `y1f()`, `y1l()`, `yn()`, `ynl()`

ynl**Name**

ynl — Bessel functions

Synopsis

```
#include <math.h>
long double ynl(long double x);
```

Description

The `ynl()` function is identical to `yn()`, except that the argument `x` and the return value is a long double.

Returns

See `yn()`.

See Also

`j0()`, `j0f()`, `j0l()`, `j1()`, `j1f()`, `j1l()`, `jn()`, `jnf()`, `jnl()`, `y0()`, `y0f()`, `y0l()`, `y1()`, `y1f()`, `y1l()`, `yn()`, `ynf()`

14.9 Interfaces for libpthread

Table 14-42 defines the library name and shared object name for the libpthread library

Table 14-42 libpthread Definition

Library:	libpthread
SONAME:	libpthread.so.0

The behavior of the interfaces in this library is specified by the following specifications:

- [LFS] Large File Support
- [LSB] This Specification
- [SUSv3] POSIX 1003.1-2001 (ISO/IEC 9945-2003)
- [SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

14.9.1 Realtime Threads

14.9.1.1 Interfaces for Realtime Threads

An LSB conforming implementation shall provide the generic functions for Realtime Threads specified in Table 14-43, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-43 libpthread - Realtime Threads Function Interfaces

pthread_attr_getinheritsched [SUSv4]	pthread_attr_getschedpolicy [SUSv4]	pthread_attr_getscope [SUSv4]	pthread_attr_setinheritsched [SUSv4]
pthread_attr_setschedpolicy [SUSv4]	pthread_attr_setscope [SUSv4]	pthread_getschedparam [SUSv4]	pthread_mutex_getprioceiling(G LIBC_2.4) [SUSv4]
pthread_mutex_setprioceiling(G LIBC_2.4) [SUSv4]	pthread_mutexattr_getprioceiling(GLIBC_2.4) [SUSv4]	pthread_mutexattr_getprotocol(G LIBC_2.4) [SUSv4]	pthread_mutexattr_setprioceiling(GLIBC_2.4) [SUSv4]
pthread_mutexattr_setprotocol(G LIBC_2.4) [SUSv4]	pthread_setschedparam [SUSv4]	pthread_setschedprio(GLIBC_2.3.4) [SUSv4]	

14.9.2 Advanced Realtime Threads

14.9.2.1 Interfaces for Advanced Realtime Threads

An LSB conforming implementation shall provide the generic functions for Advanced Realtime Threads specified in Table 14-44, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-44 libpthread - Advanced Realtime Threads Function Interfaces

pthread_barrier_destroy [SUSv4]	pthread_barrier_init [SUSv4]	pthread_barrier_wait [SUSv4]	pthread_barrierattr_destroy [SUSv4]

An LSB conforming implementation shall provide the generic deprecated functions for Posix Threads specified in Table 14-46, with the full mandatory functionality as described in the referenced underlying specification.

Note: These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.

Table 14-46 libpthread - Posix Threads Deprecated Function Interfaces

pthread_attr_get stackaddr [SUSv3]	pthread_attr_sets tackaddr [SUSv3]		
--	---------------------------------------	--	--

14.9.4 Thread aware versions of libc interfaces

14.9.4.1 Interfaces for Thread aware versions of libc interfaces

An LSB conforming implementation shall provide the generic functions for Thread aware versions of libc interfaces specified in Table 14-47, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-47 libpthread - Thread aware versions of libc interfaces Function Interfaces

lseek64 [LFS]	open64 [LFS]	pread [SUSv4]	pread64 [LSB]
pwrite [SUSv4]	pwrite64 [LSB]		

14.9.5 GNU Extensions for libpthread

14.9.5.1 Interfaces for GNU Extensions for libpthread

An LSB conforming implementation shall provide the generic functions for GNU Extensions for libpthread specified in Table 14-48, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-48 libpthread - GNU Extensions for libpthread Function Interfaces

pthread_getattr_np [LSB]	pthread_mutex_consistent_np [LSB]	pthread_mutexattr_getrobust_np [LSB]	pthread_mutexattr_setrobust_np [LSB]
pthread_rwlockattr_getkind_np [LSB]	pthread_rwlockattr_setkind_np [LSB]		

14.9.6 System Calls

14.9.6.1 Interfaces for System Calls

An LSB conforming implementation shall provide the generic functions for System Calls specified in Table 14-49, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-49 libpthread - System Calls Function Interfaces

close [SUSv4]	fcntl [LSB]	fork [SUSv4]	fsync [SUSv4]
lseek [SUSv4]	msync [SUSv4]	nanosleep [SUSv4]	open [SUSv4]

14.10 Data Definitions for libpthread

This section defines global identifiers and their values that are associated with interfaces contained in libpthread. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

```

14.11 Interface Definitions for libpthread

The interfaces defined on the following pages are included in libpthread and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 14.9 shall behave as described in the referenced base document.

_pthread_cleanup_pop

Name

`_pthread_cleanup_pop` — establish cancellation handlers

Synopsis

```
#include <pthread.h>
void _pthread_cleanup_pop(struct _pthread_cleanup_buffer *, int);
```

Description

The `_pthread_cleanup_pop()` function provides an implementation of the `pthread_cleanup_pop()` macro described in *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*.

The `_pthread_cleanup_pop()` function is not in the source standard; it is only in the binary standard.

_pthread_cleanup_push

Name

`_pthread_cleanup_push` — establish cancellation handlers

Synopsis

```
#include <pthread.h>
void _pthread_cleanup_push(struct _pthread_cleanup_buffer *, void (*)
(void *), void *);
```

Description

The `_pthread_cleanup_push()` function provides an implementation of the `pthread_cleanup_push()` macro described in *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*.

The `_pthread_cleanup_push()` function is not in the source standard; it is only in the binary standard.

pthread_getattr_np

Name

pthread_getattr_np — get thread attributes

Synopsis

```
#include <pthread.h>
int pthread_getattr_np(pthread_t thread, pthread_attr_t *attr);
```

Description

pthread_getattr_np() fills in the thread attribute object *attr* with attribute values describing the running thread *thread*. This is useful to detect runtime changes from the values specified in the thread attributes object used to create the thread with pthread_create(). The following differences may be noted:

- The detach state, since a joinable thread may have detached itself after creation. Use pthread_attr_getdetachstate() to extract from *attr*.
- The stack size, which the implementation may align to a suitable boundary. Use pthread_attr_getstack() to extract from *attr*.
- The guard size, which the implementation may round upwards to a multiple of the page size, or ignore (i.e., treat as 0), if the application is allocating its own stack. Use pthread_attr_getguardsize() to extract from *attr*.

If the stack address attribute was not set in the thread attributes object used to create the thread, then the thread attributes object returned by pthread_getattr_np() will show the actual stack address the implementation selected for the thread. Use pthread_attr_getstack() to extract from *attr*.

The thread attributes object *attr* should be destroyed using pthread_attr_destroy() when it is no longer needed.

Return Value

On success, pthread_getattr_np() returns 0; on error, it returns a non-zero error number.

Errors

ENOMEM

Insufficient memory to complete the operation.

In addition, if *thread* refers to the main thread, then pthread_getattr_np() may also fail due to errors from various underlying calls: fopen(), if the pseudo-file containing the memory region map cannot be opened; getrlimit() if the RLIMIT_STACK resource limit is not supported.

Notes

This function is a GNU extension.

See Also

```
pthread_attr_destroy(),           pthread_attr_getdetachstate(),
pthread_attr_getguardsize(),     pthread_attr_getstack(),
pthread_create().
```

pthread_mutex_consistent_np

Name

pthread_mutex_consistent_np — mark state protected by robust mutex as consistent

Synopsis

```
#include <pthread.h>
int pthread_mutex_consistent_np(pthread_mutex_t * __mutex);
```

Description

pthread_mutex_consistent_np() shall behave as described for pthread_mutex_consistent() in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

pthread_mutexattr_getrobust_np, pthread_mutexattr_setrobust_np

Name

pthread_mutexattr_getrobust_np,
pthread_mutexattr_setrobust_np — get and set the mutex robust attribute

Synopsis

```
#include <pthread.h>
int pthread_mutexattr_getrobust_np(const pthread_mutexattr_t * __attr,
int * __robustness);
int pthread_mutexattr_setrobust_np(const pthread_mutexattr_t * __attr,
int __robustness);
```

Description

pthread_mutexattr_setrobust_np() shall behave as described for pthread_mutexattr_setrobust() in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

pthread_mutexattr_getrobust_np() shall behave as described for pthread_mutexattr_getrobust() in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Two additional valid values are defined for `__robustness`: `PTHREAD_MUTEX_STALLED_NP`, which is identical to `PTHREAD_MUTEX_STALLED` and `PTHREAD_MUTEX_ROBUST_NP`, which is identical to `PTHREAD_MUTEX_ROBUST`.

pthread_rwlockattr_getkind_np, pthread_rwlockattr_setkind_np

Name

pthread_rwlockattr_getkind_np,
pthread_rwlockattr_setkind_np — get/set the read-write lock kind of the thread read-write lock attribute object

Synopsis

```
#include <pthread.h>
int pthread_rwlockattr_getkind_np(const pthread_rwlockattr_t * attr,
int * pref);
int pthread_rwlockattr_setkind_np(pthread_rwlockattr_t * attr, int *
pref);
```

Description

The pthread_rwlockattr_setkind_np() function sets the kind of read-write lock of the thread read-write lock attribute object referred to by attr to the value specified with pref. The argument pref may be set to PTHREAD_RWLOCK_PREFER_READER_NP, PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP, or PTHREAD_RWLOCK_PREFER_WRITER_NP. The default lock setting is PTHREAD_RWLOCK_PREFER_READER_NP. A thread may hold multiple read locks, i.e. read locks are recursive. According to The Single Unix Specification, the behavior is unspecified when a reader tries to place a lock, and there is no write lock but writers are waiting. Giving preference to the reader, as is set by default with the PTHREAD_RWLOCK_PREFER_READER_NP value implies that the reader will receive the requested lock, even if a writer is waiting. As long as there are readers the writer will be starved. Setting the kind to PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP, avoids writer starvation as long as any read locking is not done in a recursive fashion. The pthread_rwlockattr_getkind_np() function returns the value of the read-write lock attribute of the thread read-write lock attribute object referred to by attr in the pointer pref.

Return Value

pthread_rwlockattr_setkind_np() function returns 0 on success; on error, it returns a non-zero error number. pthread_rwlockattr_setkind_np() function always returns 0.

Errors

EINVAL

pref is set to an unsupported value.

Notes

Setting the value read-write lock kind to `PTHREAD_RWLOCK_PREFER_WRITER_NP`, results in the same behavior as setting the value to `PTHREAD_RWLOCK_PREFER_READER_NP`. As long as a reader thread holds the lock the thread holding a write lock will be starved. Setting the kind value to `PTHREAD_RWLOCK_PREFER_WRITER_NONRECURSIVE_NP`, allows the writer to run. However, the writer may not be recursive as is implied by the name.

waitpid

Name

`waitpid` — wait for child process

Description

`waitpid()` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Need not support WCONTINUED or WIFCONTINUED

Implementations need not support the XSI optional functionality of `WCONTINUED()` or `WIFCONTINUED()`.

14.12 Interfaces for libgcc_s

Table 14-55 defines the library name and shared object name for the `libgcc_s` library

Table 14-55 libgcc_s Definition

Library:	<code>libgcc_s</code>
SONAME:	<code>libgcc_s.so.1</code>

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification

14.12.1 Unwind Library

14.12.1.1 Interfaces for Unwind Library

An LSB conforming implementation shall provide the generic functions for Unwind Library specified in Table 14-56, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-56 libgcc_s - Unwind Library Function Interfaces

<code>_Unwind_Backtrace</code> [LSB]	<code>_Unwind_DeleteException</code> [LSB]	<code>_Unwind_FindEnclosingFunction</code> [LSB]	<code>_Unwind_ForceUnwind</code> [LSB]
<code>_Unwind_GetCFA</code> [LSB]	<code>_Unwind_GetGR</code> [LSB]	<code>_Unwind_GetIP</code> [LSB]	<code>_Unwind_GetIPInfo</code> (GCC_4.2.0) [LSB]

_Unwind_GetLanguageSpecificData [LSB]	_Unwind_GetRegionStart [LSB]	_Unwind_RaiseException [LSB]	_Unwind_Resume [LSB]
_Unwind_Resume_or_Rethrow [LSB]	_Unwind_SetGR [LSB]	_Unwind_SetIP [LSB]	

14.13 Data Definitions for libgcc_s

This section defines global identifiers and their values that are associated with interfaces contained in libgcc_s. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

14.13.1 unwind.h

```

struct _Unwind_Context;
struct _Unwind_Exception;

```

14.14 Interface Definitions for libgcc_s

The interfaces defined on the following pages are included in libgcc_s and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 14.12 shall behave as described in the referenced base document.

_Unwind_Backtrace

Name

`_Unwind_Backtrace` — private C++ error handling method

Synopsis

```
_Unwind_Reason_Code _Unwind_Backtrace(_Unwind_Trace_Fn trace, void *
trace_argument);
```

Description

`_Unwind_Backtrace()` performs a stack backtrace using unwind data. The *trace* **callback is called for every stack frame in the call chain.** **No cleanup actions are** performed.

_Unwind_DeleteException

Name

`_Unwind_DeleteException` — private C++ error handling method

Synopsis

```
void _Unwind_DeleteException(struct _Unwind_Exception * object);
```

Description

`_Unwind_DeleteException()` deletes the given exception *object*. If a given runtime resumes normal execution after catching a foreign exception, it will not know how to delete that exception. Such an exception shall be deleted by calling `_Unwind_DeleteException()`. This is a convenience function that calls the function pointed to by the *exception_cleanup* field of the exception header.

_Unwind_FindEnclosingFunction

Name

`_Unwind_FindEnclosingFunction` — private C++ error handling method

Synopsis

```
void * _Unwind_FindEnclosingFunction(void * ip);
```

Description

`_Unwind_FindEnclosingFunction()` Find the start address of the procedure containing the specified *ip* or NULL if it cannot be found (for example, because the function has no unwind info).

Note that there is not necessarily a one-to-one correspondence between source level functions and procedures. Some functions do not have unwind-info and others are split into multiple procedures.

_Unwind_ForcedUnwind

Name

`_Unwind_ForcedUnwind` — private C++ error handling method

Synopsis

```
#include <unwind.h>
_Unwind_Reason_Code _Unwind_ForcedUnwind(struct _Unwind_Exception *
object, _Unwind_Stop_Fn stop, void * stop_parameter);
```

Description

Forced unwinding is a single-phase process. *stop* and *stop_parameter* control the termination of the unwind process instead of the usual personality routine query. Stop function *stop* is called for each unwind frame, with the parameters described for the usual personality routine below, plus an additional *stop_parameter*.

Return Value

When *stop* identifies the destination frame, it transfers control to the user code as appropriate without returning, normally after calling `_Unwind_DeleteException()`. If not, then it should return an `_Unwind_Reason_Code` value.

If *stop* returns any reason code other than `_URC_NO_REASON`, then the stack state is indeterminate from the point of view of the caller of `_Unwind_ForcedUnwind()`. Rather than attempt to return, therefore, the unwind library should use the *exception_cleanup* entry in *object*, and then call `abort()`.

_URC_NO_REASON

This is not the destination from. The unwind runtime will call frame's personality routine with the `_UA_FORCE_UNWIND` and `_UA_CLEANUP_PHASE` flag set in *actions*, and then unwind to the next frame and call the `stop()` function again.

_URC_END_OF_STACK

In order to allow `_Unwind_ForcedUnwind()` to perform special processing when it reaches the end of the stack, the unwind runtime will call it after the last frame is rejected, with a `NULL` stack pointer in the context, and the `STOP()` FUNCTION SHALL CATCH THIS CONDITION. IT MAY return this code if it cannot handle end-of-stack.

_URC_FATAL_PHASE2_ERROR

The `stop()` function may return this code for other fatal conditions like stack corruption.

_Unwind_GetCFA**Name**

`_Unwind_GetCFA` — private C++ error handling method

Synopsis

```
_Unwind_Word _Unwind_GetCFA(struct _Unwind_Context * context);
```

Description

`_Unwind_GetCFA()` shall retrieve the value of the Canonical Frame Address (CFA) of the given *context*.

_Unwind_GetGR**Name**

`_Unwind_GetGR` — private C++ error handling method

Synopsis

```
_Unwind_Word _Unwind_GetGR(struct _Unwind_Context * context, int
index);
```

Description

`_Unwind_GetGR()` returns data at *index* found in *context*. The register is identified by its index: 0 to 31 are for the fixed registers, and 32 to 127 are for the stacked registers.

During the two phases of unwinding, only GR1 has a guaranteed value, which is the global pointer of the frame referenced by the unwind *context*. If the register has its NAT bit set, the behavior is unspecified.

_Unwind_GetIP**Name**

`_Unwind_GetIP` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetIP(struct _Unwind_Context * context);
```

Description

`_Unwind_GetIP()` returns the instruction pointer value for the routine identified by the unwind *context*.

_Unwind_GetIPInfo**Name**

`_Unwind_GetIPInfo` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetIPInfo(struct _Unwind_Context * context, int *
ip_before_insn);
```

Description

`_Unwind_GetIPInfo()` returns the instruction pointer value for the routine identified by the unwind *context* and sets *ip_before_insn* flag indicating whether that IP is before or after first not yet fully executed instruction.

_Unwind_GetLanguageSpecificData**Name**

`_Unwind_GetLanguageSpecificData` — private C++ error handling method

Synopsis

```
#include <unwind.h>
_Unwind_Ptr _Unwind_GetLanguageSpecificData(struct _Unwind_Context *
context);
```

Description

`_Unwind_GetLanguageSpecificData()` returns the address of the language specific data area for the current stack frame described by *context*.

_Unwind_GetRegionStart**Name**

`_Unwind_GetRegionStart` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetRegionStart(struct _Unwind_Context * context);
```

Description

`_Unwind_GetRegionStart()` routine returns the address (i.e., 0) of the beginning of the procedure or code fragment described by the current unwind descriptor block.

_Unwind_RaiseException

Name

`_Unwind_RaiseException` — private C++ error handling method

Synopsis

```
_Unwind_Reason_Code _Unwind_RaiseException(struct _Unwind_Exception
* object);
```

Description

`_Unwind_RaiseException()` raises an exception, passing along the given exception *object*, which should have its *exception_class* and *exception_cleanup* fields set. The exception object has been allocated by the language-specific runtime, and has a language-specific format, exception that it shall contain an `_Unwind_Exception`.

Return Value

`_Unwind_RaiseException()` does not return unless an error condition is found. If an error condition occurs, an `_Unwind_Reason_Code` is returned:

`_URC_END_OF_STACK`

The unwinder encountered the end of the stack during phase one without finding a handler. The unwind runtime will not have modified the stack. The C++ runtime will normally call `uncaught_exception()` in this case.

`_URC_FATAL_PHASE1_ERROR`

The unwinder encountered an unexpected error during phase one, because of something like stack corruption. The unwind runtime will not have modified the stack. The C++ runtime will normally call `terminate()` in this case.

`_URC_FATAL_PHASE2_ERROR`

The unwinder encountered an unexpected error during phase two. This is usually a *throw*, which will call `terminate()`.

_Unwind_Resume

Name

`_Unwind_Resume` — private C++ error handling method

Synopsis

```
void _Unwind_Resume(struct _Unwind_Exception * object);
```

Description

`_Unwind_Resume()` resumes propagation of an existing exception *object*. A call to this routine is inserted as the end of a landing pad that performs cleanup, but does not resume normal execution. It causes unwinding to proceed further.

_Unwind_Resume_or_Rethrow**Name**

`_Unwind_Resume_or_Rethrow` — private C++ error handling method

Synopsis

```
_Unwind_Reason_Code _Unwind_Resume_or_Rethrow(struct
_Unwind_Exception * exception_object);
```

Description

If the unwind was initiated due to a forced unwind, `_Unwind_Resume_or_Rethrow()` shall resume that operation, else it shall re-raise the exception.

_Unwind_SetGR**Name**

`_Unwind_SetGR` — private C++ error handling method

Synopsis

```
void _Unwind_SetGR(struct _Unwind_Context * context, int index, uint
value);
```

Description

`_Unwind_SetGR()` sets the *value* of the register *indexed* for the routine identified by the unwind *context*.

_Unwind_SetIP**Name**

`_Unwind_SetIP` — private C++ error handling method

Synopsis

```
#include <unwind.h>
void _Unwind_SetIP(struct _Unwind_Context * context, _Unwind_Ptr
value);
```

Description

`_Unwind_SetIP()` sets the instruction pointer for the routine identified by the unwind *context* to *value*.

14.15 Interfaces for libdl

Table 14-57 defines the library name and shared object name for the libdl library

Table 14-57 libdl Definition

Library:	libdl
SONAME:	libdl.so.2

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification

[SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

14.15.1 Dynamic Loader

14.15.1.1 Interfaces for Dynamic Loader

An LSB conforming implementation shall provide the generic functions for Dynamic Loader specified in Table 14-58, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-58 libdl - Dynamic Loader Function Interfaces

dladdr [LSB]	dlclose [SUSv4]	dLError [SUSv4]	dlopen [LSB]
dlsym [LSB]	dlvsym [LSB]		

14.16 Data Definitions for libdl

This section defines global identifiers and their values that are associated with interfaces contained in libdl. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

14.16.1 dlfcn.h

```
#define RTLD_NEXT      ((void *) -1L)
#define RTLD_DEFAULT    ((void *) 0)
#define RTLD_LOCAL      0
#define RTLD_LAZY       0x00001
#define RTLD_NOW        0x00002
#define RTLD_NOLOAD     0x00004
#define RTLD_DEEPBIND   0x00008
#define RTLD_GLOBAL     0x00100
#define RTLD_NODELETE   0x01000

typedef struct {
    char *dli_fname;
    void *dli_fbase;
    char *dli_sname;
    void *dli_saddr;
} Dl_info;
extern int dladdr(const void *__address, Dl_info * __info);
```

```
extern int dlclose(void *__handle);
extern char *dlerror(void);
extern void *dlopen(const char *__file, int __mode);
extern void *dlsym(void *__handle, const char *__name);
extern void *dlvsym(void *__handle, const char *__name, const char
*version);
```

14.17 Interface Definitions for libdl

The interfaces defined on the following pages are included in libdl and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 14.15 shall behave as described in the referenced base document.

dladdr

Name

dladdr — find the shared object containing a given address

Synopsis

```
#include <dlfcn.h>

typedef struct {
    const char *dli_fname;
    void *dli_fbase;
    const char *dli_sname;
    void *dli_saddr;
```

```

} Dl_info;

int dladdr(const void * addr, Dl_info * dli);

```

Description

The `dladdr()` function shall query the dynamic linker for information about the shared object containing the address *addr*. The information shall be returned in the user supplied data structure referenced by *dli*.

The structure shall contain at least the following members:

dli_fname

The pathname of the shared object containing the address

dli_fbase

The base address at which the shared object is mapped into the address space of the calling process.

dli_sname

The name of the nearest runtime symbol with value less than or equal to *addr*. Where possible, the symbol name shall be returned as it would appear in C source code.

If no symbol with a suitable value is found, both this field and *dli_saddr* shall be set to `NULL`.

dli_saddr

The address of the symbol returned in *dli_sname*. This address has type "pointer to *type*", where *type* is the type of the symbol *dli_sname*.

Example: If the symbol in *dli_sname* is a function, then the type of *dli_saddr* is of type "pointer to function".

The behavior of `dladdr()` is only specified in dynamically linked programs.

Return Value

On success, `dladdr()` shall return non-zero, and the structure referenced by *dli* shall be filled in as described. Otherwise, `dladdr()` shall return zero, and the cause of the error can be fetched with `dlerror()`.

Errors

See `dlerror()`.

Environment

`LD_LIBRARY_PATH`

directory search-path for object files

dlopen

Name

dlopen — open dynamic object

Synopsis

```
#include <dlfcn.h>

void * dlopen(const char * filename, int flag);
```

Description

The `dlopen()` function shall behave as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with additional behaviors listed below.

If the file argument does not contain a <slash> character, then the system shall look for a library of that name in at least the following directories, and use the first one which is found:

- The directories specified by the `DT_RPATH` dynamic entry.
- The directories specified in the `LD_LIBRARY_PATH` environment variable (which is a colon separated list of pathnames). This step shall be skipped for `setuid` and `setgid` executables.
- A set of directories sufficient to contain the libraries specified in this standard.

Note: Traditionally, `/lib` and `/usr/lib`. This case would also cover cases in which the system used the mechanism of `/etc/ld.so.conf` and `/etc/ld.so.cache` to provide access.

Example: An application which is not linked against `libm` may choose to `dlopen libm`.

Additional flags

In addition to the available values for `flag` as documented in POSIX 1003.1-2008 (ISO/IEC 9945-2009), the following values may also be ORed into `flag`:

RTLD_NODELETE

Do not unload the library during `dlclose()`. Consequently, the library's static variables are not reinitialized if the library is reloaded with `dlopen()` at a later time.

RTLD_NOLOAD

Do not load the library. This can be used to test if the library is already resident. `dlopen()` returns a `NULL` pointer if it is not resident; it returns the library's handle if it is resident. This flag can also be used to promote the flags on a library that is already loaded. For example, a library that was previously loaded with `RTLD_LOCAL` can be reopened using `RTLD_NOLOAD|RTLD_GLOBAL`.

RTLD_DEEPBIND

Place the lookup scope of the symbols in this library ahead of the global scope. This means that a self-contained library will use its own symbols in preference to global symbols with the same name contained in libraries that have already been loaded.

dlsym

Name

`dlsym` — obtain the address of a symbol from a dlopen object

Description

`dlsym()` is as specified in the POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

RTLD_NEXT, RTLD_DEFAULT Required

The values `RTLD_NEXT` and `RTLD_DEFAULT`, described as reserved for future use in POSIX 1003.1-2008 (ISO/IEC 9945-2009), are required, with behavior as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

dlvsym

Name

`dlvsym` — obtain the address of a symbol from a dlopen object

Synopsis

```
#include <dlfcn.h>
void * dlvsym(void * handle, char * name, char * version);
```

Description

`dlvsym()` does the same as `dlsym()` but takes a version string as an additional argument.

14.18 Interfaces for librt

Table 14-59 defines the library name and shared object name for the librt library

Table 14-59 librt Definition

Library:	librt
SONAME:	librt.so.1

The behavior of the interfaces in this library is specified by the following specifications:

- [LFS] Large File Support
- [SU5v4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

14.18.1 Shared Memory Objects

14.18.1.1 Interfaces for Shared Memory Objects

An LSB conforming implementation shall provide the generic functions for Shared Memory Objects specified in Table 14-60, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-60 librt - Shared Memory Objects Function Interfaces

shm_open [SUSv4]	shm_unlink [SUSv4]		
---------------------	-----------------------	--	--

14.18.2 Asynchronous I/O

14.18.2.1 Interfaces for Asynchronous I/O

An LSB conforming implementation shall provide the generic functions for Asynchronous I/O specified in Table 14-61, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-61 librt - Asynchronous I/O Function Interfaces

aio_cancel [SUSv4]	aio_cancel64 [LFS]	aio_error [SUSv4]	aio_error64 [LFS]

14.20 Interfaces for libcrypt

Table 14-65 defines the library name and shared object name for the libcrypt library

Table 14-65 libcrypt Definition

Library:	libcrypt
SONAME:	libcrypt.so.1

The behavior of the interfaces in this library is specified by the following specifications:

- [LSB] This Specification
- [SUSv4] POSIX 1003.1-2008 (ISO/IEC 9945-2009)

14.20.1 Encryption

14.20.1.1 Interfaces for Encryption

An LSB conforming implementation shall provide the generic functions for Encryption specified in Table 14-66, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-66 libcrypt - Encryption Function Interfaces

crypt [SUSv4]	crypt_r [LSB]	encrypt [SUSv4]	encrypt_r [LSB]
setkey [SUSv4]	setkey_r [LSB]		

14.21 Data Definitions for libcrypt

This section defines global identifiers and their values that are associated with interfaces contained in libcrypt. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

14.21.1 crypt.h

```

struct crypt_data {
    char keysched[128];
    char sb0[32768];
    char sb1[32768];
    char sb2[32768];
    char sb3[32768];
    char crypt_3_buf[14];
    char current_salt[2];
    long int current_saltbits;
    int direction;
    int initialized;
};
extern char *crypt_r(const char *key, const char *salt,
                    struct crypt_data *data);
extern void encrypt_r(const char *block, int edflag,
                    struct crypt_data *data);
extern void setkey_r(const char *key, struct crypt_data *data);

```

14.22 Interface Definitions for libcrypt

The interfaces defined on the following pages are included in libcrypt and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 14.20 shall behave as described in the referenced base document.

crypt_r

Name

crypt_r — Cryptographic string encoding function

Synopsis

```
#include <crypt.h>
char * crypt_r(const char * key, const char * salt, struct crypt_data
* data);
```

Description

The `crypt_r()` function is a re-entrant version of the `crypt()` function. `crypt_r()` shall behave as specified for `crypt()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with an additional parameter, a pointer to a structure which is used to store result data and bookkeeping information.

The caller should set the *initialized* field of the `crypt_data` structure to zero before the first call to `crypt_r()`.

Notes

INSERT TEXT HERE

See Also

`crypt()`, `setkey_r()`, `encrypt_r()`.

encrypt_r

Name

encrypt_r — Cryptographic encoding function

Synopsis

```
#include <crypt.h>
void encrypt_r(const char * block, int edflag, struct crypt_data *
data);
```

Description

The `encrypt_r()` function is a re-entrant version of the `encrypt()` function. `encrypt_r()` shall behave as specified for `encrypt()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with an additional parameter, a pointer to a structure which is used to store result data and bookkeeping information.

Notes

`encrypt()`, `crypt_r()`, `setkey_r()`.

setkey_r**Name**

setkey_r — Set cryptographic encoding key

Synopsis

```
#include <crypt.h>
void setkey_r(const char * key, struct crypt_data * data);
```

Description

The `setkey_r()` function is a re-entrant version of the `setkey()` function. `setkey_r()` shall behave as specified for `setkey()` in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with an additional parameter, a pointer to a structure which is used to store result data and bookkeeping information.

The caller should set the *initialized* field of the `crypt_data` structure to zero before the first call to `setkey_r()`.

14.23 Interfaces for libpam

Table 14-67 defines the library name and shared object name for the libpam library

Table 14-67 libpam Definition

Library:	libpam
SONAME:	libpam.so.0

The Pluggable Authentication Module (PAM) interfaces allow applications to request authentication via a system administrator defined mechanism, known as a *service*.

A single service name, *other*, shall always be present. The behavior of this service shall be determined by the system administrator. Additional service names may also exist.

Note: Future versions of this specification might define additional service names.

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification
[PAM] PAM

14.23.1 Pluggable Authentication API

14.23.1.1 Interfaces for Pluggable Authentication API

An LSB conforming implementation shall provide the generic functions for Pluggable Authentication API specified in Table 14-68, with the full mandatory functionality as described in the referenced underlying specification.

Table 14-68 libpam - Pluggable Authentication API Function Interfaces

pam_acct_mgmt(LIBPAM_1.0) [LSB]	pam_authenticate(LIBPAM_1.0) [LSB]	pam_chauthtok(LIBPAM_1.0) [LSB]	pam_close_session(LIBPAM_1.0) [LSB]
pam_end(LIBPAM_1.0) [LSB]	pam_fail_delay(LIBPAM_1.0) [LSB]	pam_get_data(LIBPAM_1.0) [PAM]	pam_get_item(LIBPAM_1.0) [LSB]
pam_get_user(LIBPAM_1.0) [PAM]	pam_getenv(LIBPAM_1.0) [LSB]	pam_getenvlist(LIBPAM_1.0) [LSB]	pam_open_session(LIBPAM_1.0) [LSB]
pam_putenv(LIBPAM_1.0) [LSB]	pam_set_data(LIBPAM_1.0) [PAM]	pam_set_item(LIBPAM_1.0) [LSB]	pam_setcred(LIBPAM_1.0) [LSB]
pam_start(LIBPAM_1.0) [LSB]	pam_strerror(LIBPAM_1.0) [LSB]		

14.24 Data Definitions for libpam

This section defines global identifiers and their values that are associated with interfaces contained in libpam. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

14.24.1 security/_pam_types.h

```
typedef struct pam_handle pam_handle_t;
struct pam_message {
    int msg_style;
    const char *msg;
};
struct pam_response {
```

```

    char *resp;
    int resp_retcode;          /* currently un-used, zero expected
*/
};

struct pam_conv {
    int (*conv) (int num_msg, const struct pam_message * *msg,

void (*)(pam_handle_t *, void *, int));

```

14.25 Interface Definitions for libpam

The interfaces defined on the following pages are included in libpam and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 14.23 shall behave as described in the referenced base document.

pam_acct_mgmt

Name

pam_acct_mgmt — establish the status of a user's account

Synopsis

```
#include <security/pam_appl.h>
int pam_acct_mgmt(pam_handle_t * pamh, int flags);
```

Description

pam_acct_mgmt() establishes the account's usability and the user's accessibility to the system. It is typically called after the user has been authenticated.

flags may be specified as any valid flag (namely, one of those applicable to the *flags* argument of pam_authenticate()). Additionally, the value of *flags* may be logically or'd with PAM_SILENT.

Return Value

PAM_SUCCESS

Success.

PAM_NEW_AUTHTOK_REQD

User is valid, but user's authentication token has expired. The correct response to this return-value is to require that the user satisfy the pam_chauthtok() function before obtaining service. It may not be possible for an application to do this. In such a case, the user should be denied access until the account password is updated.

PAM_ACCT_EXPIRED

User is no longer permitted access to the system.

PAM_AUTH_ERR

Authentication error.

PAM_PERM_DENIED

User is not permitted to gain access at this time.

PAM_USER_UNKNOWN

User is not known to a module's account management component.

Note: Errors may be translated to text with pam_strerror().

pam_authenticate

Name

pam_authenticate — authenticate the user

Synopsis

```
#include <security/pam_appl.h>
int pam_authenticate(pam_handle_t * pamh, int flags);
```

Description

pam_authenticate() serves as an interface to the authentication mechanisms of the loaded modules.

flags is an optional parameter that may be specified by the following value:

PAM_DISALLOW_NULL_AUTHTOK

Instruct the authentication modules to return PAM_AUTH_ERR if the user does not have a registered authorization token.

Additionally, the value of *flags* may be logically or'd with PAM_SILENT.

The process may need to be privileged in order to successfully call this function.

Return Value

PAM_SUCCESS

Success.

PAM_AUTH_ERR

User was not authenticated or process did not have sufficient privileges to perform authentication.

PAM_CRED_INSUFFICIENT

Application does not have sufficient credentials to authenticate the user.

PAM_AUTHINFO_UNAVAIL

Modules were not able to access the authentication information. This might be due to a network or hardware failure, etc.

PAM_USER_UNKNOWN

Supplied username is not known to the authentication service.

PAM_MAXTRIES

One or more authentication modules has reached its limit of tries authenticating the user. Do not try again.

PAM_ABORT

One or more authentication modules failed to load.

Note: Errors may be translated to text with pam_strerror().

pam_chauthtok

Name

pam_chauthtok — change the authentication token for a given user

Synopsis

```
#include <security/pam_appl.h>
int pam_chauthtok(pam_handle_t * pamh, const int flags);
```

Description

pam_chauthtok() is used to change the authentication token for a given user as indicated by the state associated with the handle *pamh*.

flags is an optional parameter that may be specified by the following value:

PAM_CHANGE_EXPIRED_AUTH Tok

User's authentication token should only be changed if it has expired.

Additionally, the value of *flags* may be logically or'd with PAM_SILENT.

RETURN VALUE

PAM_SUCCESS

Success.

PAM_AUTH Tok_ERR

A module was unable to obtain the new authentication token.

PAM_AUTH Tok_RECOVER_ERR

A module was unable to obtain the old authentication token.

PAM_AUTH Tok_LOCK_BUSY

One or more modules were unable to change the authentication token since it is currently locked.

PAM_AUTH Tok_DISABLE_AGING

Authentication token aging has been disabled for at least one of the modules.

PAM_PERM_DENIED

Permission denied.

PAM_TRY_AGAIN

Not all modules were in a position to update the authentication token(s). In such a case, none of the user's authentication tokens are updated.

PAM_USER_UNKNOWN

User is not known to the authentication token changing service.

Note: Errors may be translated to text with `pam_strerror()`.

pam_close_session

Name

`pam_close_session` — indicate that an authenticated session has ended

Synopsis

```
#include <security/pam_appl.h>
int pam_close_session(pam_handle_t * pamh, int flags);
```

Description

`pam_close_session()` is used to indicate that an authenticated session has ended. It is used to inform the module that the user is exiting a session. It should be possible for the PAM library to open a session and close the same session from different applications.

flags may have the value `PAM_SILENT` to indicate that no output should be generated as a result of this function call.

Return Value

`PAM_SUCCESS`

Success.

`PAM_SESSION_ERR`

One of the required loaded modules was unable to close a session for the user.

Note: Errors may be translated to text with `pam_strerror()`.

pam_end

Name

`pam_end` — terminate the use of the PAM library

Synopsis

```
#include <security/pam_appl.h>
int pam_end(pam_handle_t * pamh, int pam_status);
```

Description

`pam_end()` terminates use of the PAM library. On success, the contents of **pamh* are no longer valid, and all memory associated with it is invalid.

Normally, *pam_status* is passed the value `PAM_SUCCESS`, but in the event of an unsuccessful service application, the appropriate PAM error return value should be used.

Return Value

`PAM_SUCCESS`

Success.

Note: Errors may be translated to text with `pam_strerror()`.

pam_fail_delay

Name

`pam_fail_delay` — specify delay time to use on authentication error

Synopsis

```
#include <security/pam_appl.h>
int pam_fail_delay(pam_handle_t * pamh, unsigned int micro_sec);
```

Description

`pam_fail_delay()` specifies the minimum delay for the PAM library to use when an authentication error occurs. The actual delay can vary by as much as 25%. If this function is called multiple times, the longest time specified by any of the call will be used.

The delay is invoked if an authentication error occurs during the `pam_authenticate()` or `pam_chauthtok()` function calls.

Independent of the success of `pam_authenticate()` or `pam_chauthtok()`, the delay time is reset to its default value of 0 when the PAM library returns control to the application from these two functions.

Return Value

`PAM_SUCCESS`

Success.

Note: Errors may be translated to text with `pam_strerror()`.

pam_get_item

Name

`pam_get_item` — obtain the value of the indicated item.

Synopsis

```
#include <security/pam_appl.h>
int pam_get_item(const pam_handle_t * pamh, int item_type, const void
* * item);
```

Description

`pam_get_item()` obtains the value of the indicated *item_type*. The possible values of *item_type* are the same as listed for `pam_set_item()`.

On success, *item* contains a pointer to the value of the corresponding item. Note that this is a pointer to the actual data and should not be `free()`'d or over-written.

Return Value

PAM_SUCCESS

Success.

PAM_PERM_DENIED

Application passed a NULL pointer for *item*.

PAM_BAD_ITEM

Application attempted to get an undefined item.

Note: Errors may be translated to text with `pam_strerror()`.

pam_getenv

Name

`pam_getenv` — get a PAM environment variable

Synopsis

```
#include <security/pam_appl.h>
const char * pam_getenv(const pam_handle_t * pamh, const char * name);
```

Description

The `pam_getenv()` function shall search the environment associated with the PAM handle *pamh* for the environment variable *name*. If the specified environment variable cannot be found, a null pointer shall be returned. The application shall ensure that it does not modify the string pointed to by the `pam_getenv()` function.

Return Value

On success, `pam_getenv()` returns a pointer to a string of the form *name=value*.

pam_getenvlist

Name

`pam_getenvlist` — returns a pointer to the complete PAM environment.

Synopsis

```
#include <security/pam_appl.h>
char * const * pam_getenvlist(pam_handle_t * pamh);
```

Description

`pam_getenvlist()` returns a pointer to the complete PAM environment. This pointer points to an array of pointers to NUL-terminated strings and must be terminated by a NULL pointer. Each string has the form "name=value".

The PAM library module allocates memory for the returned value and the associated strings. The calling application is responsible for freeing this memory.

Return Value

`pam_getenvlist()` returns an array of string pointers containing the PAM environment. On error, NULL is returned.

pam_open_session

Name

`pam_open_session` — indicate session has started

Synopsis

```
#include <security/pam_appl.h>
int pam_open_session(pam_handle_t * pamh, int flags);
```

Description

The `pam_open_session()` function is used to indicate that an authenticated session has begun, after the user has been identified (see `pam_authenticate()`) and, if necessary, granted credentials (see `pam_setcred()`). It is used to inform the module that the user is currently in a session. It should be possible for the PAM library to open a session and close the same session from different applications.

flags may have the value `PAM_SILENT` to indicate that no output be generated as a result of this function call.

Return Value

`PAM_SUCCESS`

Success.

`PAM_SESSION_ERR`

One of the loaded modules was unable to open a session for the user.

Note: Errors may be translated to text with `pam_strerror()`.

pam_putenv

Name

pam_putenv — Add, replace or delete a PAM environment variable

Synopsis

```
#include <security/pam_appl.h>
int pam_putenv(const pam_handle_t * pamh, const char * name_value);
```

Description

The `pam_putenv()` function shall modify the environment list associated with *pamh*. If *name_value* contains an '=' character, the characters to the left of the first '=' character represent the *name*, and the remaining characters after the '=' represent the *value*.

If the *name* environment variable exists in the environment associated with *pamh*, it shall be modified to have the value *value*. Otherwise, the *name* shall be added to the environment associated with *pamh* with the value *value*.

If there is no '=' character in *name_value*, the variable in the environment associated with *pamh* named *name_value* shall be deleted.

Return Value

On success, the `pam_putenv()` function shall return `PAM_SUCCESS`. Otherwise the return value indicates the error:

`PAM_PERM_DENIED`

The *name_value* argument is a null pointer.

`PAM_BAD_ITEM`

The PAM environment variable named *name_value* does not exist and therefore cannot be deleted.

`PAM_ABORT`

The PAM handle identified by *pamh* is corrupt.

`PAM_BUF_ERR`

Memory buffer error.

pam_set_item

Name

pam_set_item — (re)set the value of an item.

Synopsis

```
#include <security/pam_appl.h>
int pam_set_item(pam_handle_t * pamh, int item_type, const void * item);
```

Description

pam_set_item() (re)sets the value of one of the following item_types:

PAM_SERVICE

service name

PAM_USER

user name

PAM_TTY

terminal name

The value for a device file should include the /dev/ prefix. The value for graphical, X-based, applications should be the \$DISPLAY variable.

PAM_RHOST

remote host name

PAM_CONV

conversation structure

PAM_RUSER

remote user name

PAM_USER_PROMPT

string to be used when prompting for a user's name

The default value for this string is Please enter username: .

For all *item_types* other than PAM_CONV, *item* is a pointer to a NULL-terminated character string. In the case of PAM_CONV, *item* points to an initialized pam_conv structure.

Return Value

PAM_SUCCESS

Success.

PAM_PERM_DENIED

An attempt was made to replace the conversation structure with a NULL value.

PAM_BUF_ERR

Function ran out of memory making a copy of the item.

PAM_BAD_ITEM

Application attempted to set an undefined item.

Note: Errors may be translated to text with `pam_strerror()`.

pam_setcred

Name

`pam_setcred` — set the module-specific credentials of the user

Synopsis

```
#include <security/pam_appl.h>
extern int pam_setcred(pam_handle_t * pamh, int flags);
```

Description

`pam_setcred()` sets the module-specific credentials of the user. It is usually called after the user has been authenticated, after the account management function has been called and after a session has been opened for the user.

flags may be specified from among the following values:

`PAM_ESTABLISH_CRED`

set credentials for the authentication service

`PAM_DELETE_CRED`

delete credentials associated with the authentication service

`PAM_REINITIALIZE_CRED`

reinitialize the user credentials

`PAM_REFRESH_CRED`

extend lifetime of the user credentials

Additionally, the value of *flags* may be logically or'd with `PAM_SILENT`.

Return Value

`PAM_SUCCESS`

Success.

`PAM_CRED_UNAVAIL`

Module cannot retrieve the user's credentials.

`PAM_CRED_EXPIRED`

User's credentials have expired.

`PAM_USER_UNKNOWN`

User is not known to an authentication module.

`PAM_CRED_ERR`

Module was unable to set the credentials of the user.

Note: Errors may be translated to text with `pam_strerror()`.

pam_start

Name

pam_start — initialize the PAM library

Synopsis

```
#include <security/pam_appl.h>
int pam_start(const char * service_name, const char * user, const struct
pam_conv * pam_conversation, pam_handle_t * * pamh);
```

Description

pam_start() is used to initialize the PAM library. It must be called prior to any other usage of the PAM library. On success, **pamh* becomes a handle that provides continuity for successive calls to the PAM library. pam_start() expects arguments as follows: the *service_name* of the program, the *username* of the individual to be authenticated, a pointer to an application-supplied pam_conv structure, and a pointer to a *pam_handle_t* pointer.

An application must provide the *conversation function* used for direct communication between a loaded module and the application. The application also typically provides a means for the module to prompt the user for a password, etc.

The structure, pam_conv, is defined to be,

```
struct pam_conv {
    int (*conv) (int num_msg,
                const struct pam_message * *msg,
                struct pam_response * *resp,
                void *appdata_ptr);
    void *appdata_ptr;
```

```
};
```

It is initialized by the application before it is passed to the library. The contents of this structure are attached to the **pamh* handle. The point of this argument is to provide a mechanism for any loaded module to interact directly with the application program; this is why it is called a conversation structure.

When a module calls the referenced `conv()` function, *appdata_ptr* is set to the second element of this structure.

The other arguments of a call to `conv()` concern the information exchanged by module and application. *num_msg* holds the length of the array of pointers passed via *msg*. On success, the pointer *resp* points to an array of *num_msg* `pam_response` structures, holding the application-supplied text. Note that *resp* is a struct `pam_response` array and not an array of pointers.

Return Value

PAM_SUCCESS

Success.

PAM_BUF_ERR

Memory allocation error.

PAM_ABORT

Internal failure.

ERRORS

May be translated to text with `pam_strerror()`.

pam_strerror

Name

`pam_strerror` — returns a string describing the PAM error

Synopsis

```
#include <security/pam_appl.h>
const char * pam_strerror(pam_handle_t * pamh, int errnum);
```

Description

`pam_strerror()` returns a string describing the PAM error associated with *errnum*.

Return Value

On success, this function returns a description of the indicated error. The application should not free or modify this string. Otherwise, a string indicating that the error is unknown shall be returned. It is unspecified whether or not the string returned is translated according to the setting of `LC_MESSAGES`.

IV Utility Libraries

15 Utility Libraries

15.1 Introduction

An LSB-conforming implementation shall also support the following utility libraries which are built on top of the interfaces provided by the base libraries. These libraries implement common functionality, and hide additional system dependent information such as file formats and device names.

- libz
- libncurses
- libncursesw
- libutil

The structure of the definitions for these libraries follows the same model as used for Base Libraries.

15.2 Interfaces for libz

Table 15-1 defines the library name and shared object name for the libz library

Table 15-1 libz Definition

Library:	libz
SONAME:	libz.so.1

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification

15.2.1 Compression Library

15.2.1.1 Interfaces for Compression Library

An LSB conforming implementation shall provide the generic functions for Compression Library specified in Table 15-2, with the full mandatory functionality as described in the referenced underlying specification.

Table 15-2 libz - Compression Library Function Interfaces

adler32 [LSB]	compress [LSB]	compress2 [LSB]	compressBound(ZLIB_1.2.0) [LSB]

15.3 Data Definitions for libz

This section defines global identifiers and their values that are associated with interfaces contained in libz. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

15.3.1 zconf.h

```
#define ZEXPORT
#define ZEXPORTVA
#define OF(args)      args
#define ZEXTERN extern
```

15.3.2 zlib.h

```
#define ZLIB_VERSION    "1.2.2"
#define Z_NULL  0
#define MAX_WBITS    15      /* 32K LZ77 window */

15.4 Interface Definitions for libz

The interfaces defined on the following pages are included in libz and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 15.2 shall behave as described in the referenced base document.

adler32

Name

adler32 — compute Adler 32 Checksum

Synopsis

```
#include <zlib.h>
uLong Adler32(uLong Adler, const Bytef * buf, uInt len);
```

Description

The `adler32()` function shall compute a running Adler-32 checksum (as described in RFC 1950: ZLIB Compressed Data Format Specification). On entry, *adler* is the previous value for the checksum, and *buf* shall point to an array of *len* bytes of data to be added to this checksum. The `adler32()` function shall return the new checksum.

If *buf* is `NULL` (or `Z_NULL`), `adler32()` shall return the initial checksum.

Return Value

The `adler32()` function shall return the new checksum value.

Errors

None defined.

Application Usage (informative)

The following code fragment demonstrates typical usage of the `adler32()` function:

```
uLong Adler = Adler32(0L, Z_NULL, 0);

while (read_buffer(buffer, length) != EOF) {
    Adler = Adler32(Adler, buffer, length);
}
if (Adler != original_Adler) error();
```

compress

Name

compress — compress data

Synopsis

```
#include <zlib.h>
int compress(Bytef * dest, uLongf * destLen, const Bytef * source,
uLong sourceLen);
```

Description

The `compress()` function shall attempt to compress *sourceLen* bytes of data in the buffer *source*, placing the result in the buffer *dest*.

On entry, *destLen* should point to a value describing the size of the *dest* buffer. The application should ensure that this value be at least $(sourceLen \times 1.001) + 12$. On successful exit, the variable referenced by *destLen* shall be updated to hold the length of compressed data in *dest*.

The `compress()` function is equivalent to `compress2()` with a *level* of `Z_DEFAULT_COMPRESSION`.

Return Value

On success, `compress()` shall return `Z_OK`. Otherwise, `compress()` shall return a value to indicate the error.

Errors

On error, `compress()` shall return a value as described below:

`Z_BUF_ERROR`

The buffer *dest* was not large enough to hold the compressed data.

`Z_MEM_ERROR`

Insufficient memory.

compress2

Name

compress2 — compress data at a specified level

Synopsis

```
#include <zlib.h>
int compress2(Bytef * dest, uLongf * destLen, const Bytef * source,
uLong sourceLen, int level);
```

Description

The `compress2()` function shall attempt to compress *sourceLen* bytes of data in the buffer *source*, placing the result in the buffer *dest*, at the level described by *level*. The *level* supplied shall be a value between 0 and 9, or the value `Z_DEFAULT_COMPRESSION`. A *level* of 1 requests the highest speed, while a *level* of 9 requests the highest compression. A *level* of 0 indicates that no compression should be used, and the output shall be the same as the input.

On entry, *destLen* should point to a value describing the size of the *dest* buffer. The application should ensure that this value be at least $(sourceLen \times 1.001) + 12$. On successful exit, the variable referenced by *destLen* shall be updated to hold the length of compressed data in *dest*.

The `compress()` function is equivalent to `compress2()` with a *level* of `Z_DEFAULT_COMPRESSION`.

Return Value

On success, `compress2()` shall return `Z_OK`. Otherwise, `compress2()` shall return a value to indicate the error.

Errors

On error, `compress2()` shall return a value as described below:

`Z_BUF_ERROR`

The buffer *dest* was not large enough to hold the compressed data.

`Z_MEM_ERROR`

Insufficient memory.

`Z_STREAM_ERROR`

The *level* was not `Z_DEFAULT_COMPRESSION`, or was not between 0 and 9.

compressBound

Name

`compressBound` — compute compressed data size

Synopsis

```
#include <zlib.h>
int compressBound(uLong sourceLen);
```

Description

The `compressBound()` function shall estimate the size of buffer required to compress *sourceLen* bytes of data using the `compress()` or `compress2()` functions. If successful, the value returned shall be an upper bound for the size of buffer required to compress *sourceLen* bytes of data, using the parameters stored in *stream*, in a single call to `compress()` or `compress2()`.

Return Value

The `compressBound()` shall return a value representing the upper bound of an array to allocate to hold the compressed data in a single call to `compress()` or `compress2()`. This function may return a conservative value that may be larger than *sourceLen*.

Errors

None defined.

crc32**Name**

`crc32` — compute CRC-32 Checksum

Synopsis

```
#include <zlib.h>
uLong crc32(uLong crc, const Bytef * buf, uInt len);
```

Description

The `crc32()` function shall compute a running Cyclic Redundancy Check checksum, as defined in ITU-T V.42. On entry, *crc* is the previous value for the checksum, and *buf* shall point to an array of *len* bytes of data to be added to this checksum. The `crc32()` function shall return the new checksum.

If *buf* is `NULL` (or `Z_NULL`), `crc32()` shall return the initial checksum.

Return Value

The `crc32()` function shall return the new checksum value.

Errors

None defined.

Application Usage (informative)

The following code fragment demonstrates typical usage of the `crc32()` function:

```
uLong crc = crc32(0L, Z_NULL, 0);

while (read_buffer(buffer, length) != EOF) {
    crc = crc32(crc, buffer, length);
}
if (crc != original_crc) error();
```

deflate

Name

deflate — compress data

Synopsis

```
#include <zlib.h>
int deflate(z_streamp stream, int flush);
```

Description

The `deflate()` function shall attempt to compress data until either the input buffer is empty or the output buffer is full. The *stream* references a `z_stream` structure. Before the first call to `deflate()`, this structure should have been initialized by a call to `deflateInit2_()`.

Note: `deflateInit2_()` is only in the binary standard; source level applications should initialize *stream* via a call to `deflateInit()` or `deflateInit2()`.

In addition, the *stream* input and output buffers should have been initialized as follows:

next_in

should point to the data to be compressed.

avail_in

should contain the number of bytes of data in the buffer referenced by *next_in*.

next_out

should point to a buffer where compressed data may be placed.

avail_out

should contain the size in bytes of the buffer referenced by *next_out*

The `deflate()` function shall perform one or both of the following actions:

1. Compress input data from *next_in* and update *next_in*, *avail_in* and *total_in* to reflect the data that has been compressed.
2. Fill the output buffer referenced by *next_out*, and update *next_out*, *avail_out* and *total_out* to reflect the compressed data that has been placed there. If *flush* is not `Z_NO_FLUSH`, and *avail_out* indicates that there is still space in output buffer, this action shall always occur (see below for further details).

The `deflate()` function shall return when either *avail_in* reaches zero (indicating that all the input data has been compressed), or *avail_out* reaches zero (indicating that the output buffer is full).

On success, the `deflate()` function shall set the *adler* field of the *stream* to the `adler32()` checksum of all the input data compressed so far (represented by *total_in*).

If the `deflate()` function shall attempt to determine the type of input data, and set field `data_type` in `stream` to `Z_ASCII` if the majority of the data bytes fall within the ASCII (ISO 646) printable character range. Otherwise, it shall set `data_type` to `Z_BINARY`. This data type is informational only, and does not affect the compression algorithm.

Note: Future versions of the LSB may remove this requirement, since it is based on an outdated character set that does not support Internationalization, and does not affect the algorithm. It is included for information only at this release. Applications should not depend on this field.

Flush Operation

The parameter `flush` determines when compressed bits are added to the output buffer in `next_out`. If `flush` is `Z_NO_FLUSH`, `deflate()` may return with some data pending output, and not yet added to the output buffer.

If `flush` is `Z_SYNC_FLUSH`, `deflate()` shall flush all pending output to `next_out` and align the output to a byte boundary. A synchronization point is generated in the output.

If `flush` is `Z_FULL_FLUSH`, all output shall be flushed, as for `Z_SYNC_FLUSH`, and the compression state shall be reset. A synchronization point is generated in the output.

Rationale: `Z_SYNC_FLUSH` is intended to ensure that the compressed data contains all the data compressed so far, and allows a decompressor to reconstruct all of the input data. `Z_FULL_FLUSH` allows decompression to restart from this point if the previous compressed data has been lost or damaged. Flushing is likely to degrade the performance of the compression system, and should only be used where necessary.

If `flush` is set to `Z_FINISH`, all pending input shall be processed and `deflate()` shall return with `Z_STREAM_END` if there is sufficient space in the output buffer at `next_out`, as indicated by `avail_out`. If `deflate()` is called with `flush` set to `Z_FINISH` and there is insufficient space to store the compressed data, and no other error has occurred during compression, `deflate()` shall return `Z_OK`, and the application should call `deflate()` again with `flush` unchanged, and having updated `next_out` and `avail_out`.

If all the compression is to be done in a single step, `deflate()` may be called with `flush` set to `Z_FINISH` immediately after the stream has been initialized if `avail_out` is set to at least the value returned by `deflateBound()`.

Return Value

On success, `deflate()` shall return `Z_OK`, unless `flush` was set to `Z_FINISH` and there was sufficient space in the output buffer to compress all of the input data. In this case, `deflate()` shall return `Z_STREAM_END`. On error, `deflate()` shall return a value to indicate the error.

Note: If `deflate()` returns `Z_OK` and has set `avail_out` to zero, the function should be called again with the same value for `flush`, and with updated `next_out` and `avail_out` until `deflate()` returns with `Z_OK` (or `Z_STREAM_END` if `flush` is set to `Z_FINISH`) and a non-zero `avail_out`.

Errors

On error, `deflate()` shall return a value as described below, and set the *msg* field of *stream* to point to a string describing the error:

`Z_BUF_ERROR`

No progress is possible; either *avail_in* or *avail_out* was zero.

`Z_MEM_ERROR`

Insufficient memory.

`Z_STREAM_ERROR`

The state (as represented in *stream*) is inconsistent, or *stream* was `NULL`.

deflateBound

Name

`deflateBound` — compute compressed data size

Synopsis

```
#include <zlib.h>
int deflateBound(z_streamp stream, uLong sourceLen);
```

Description

The `deflateBound()` function shall estimate the size of buffer required to compress *sourceLen* bytes of data. If successful, the value returned shall be an upper bound for the size of buffer required to compress *sourceLen* bytes of data, using the parameters stored in *stream*, in a single call to `deflate()` with flush set to `Z_FINISH`.

On entry, *stream* should have been initialized via a call to `deflateInit_()` or `deflateInit2_()`.

Return Value

The `deflateBound()` shall return a value representing the upper bound of an array to allocate to hold the compressed data in a single call to `deflate()`. If the *stream* is not correctly initialized, or is `NULL`, then `deflateBound()` may return a conservative value that may be larger than *sourceLen*.

Errors

None defined.

deflateCopy

Name

deflateCopy — copy compression stream

Synopsis

```
#include <zlib.h>
int deflateCopy(z_streamp dest, z_streamp source);
```

Description

The `deflateCopy()` function shall copy the compression state information in *source* to the uninitialized `z_stream` structure referenced by *dest*.

On successful return, *dest* will be an exact copy of the stream referenced by *source*. The input and output buffer pointers in *next_in* and *next_out* will reference the same data.

Return Value

On success, `deflateCopy()` shall return `Z_OK`. Otherwise it shall return a value less than zero to indicate the error.

Errors

On error, `deflateCopy()` shall return a value as described below:

`Z_STREAM_ERROR`

The state in *source* is inconsistent, or either *source* or *dest* was `NULL`.

`Z_MEM_ERROR`

Insufficient memory available.

Application Usage (informative)

This function can be useful when several compression strategies will be tried, for example when there are several ways of pre-processing the input data with a filter. The streams that will be discarded should then be freed by calling `deflateEnd()`. Note that `deflateCopy()` duplicates the internal compression state which can be quite large, so this strategy may be slow and can consume lots of memory.

deflateEnd

Name

deflateEnd — free compression stream state

Synopsis

```
#include <zlib.h>
int deflateEnd(z_streamp stream);
```

Description

The `deflateEnd()` function shall free all allocated state information referenced by *stream*. All pending output is discarded, and unprocessed input is ignored.

Return Value

On success, `deflateEnd()` shall return `Z_OK`, or `Z_DATA_ERROR` if there was pending output discarded or input unprocessed. Otherwise it shall return `Z_STREAM_ERROR` to indicate the error.

Errors

On error, `deflateEnd()` shall return `Z_STREAM_ERROR`. The following conditions shall be treated as an error:

- The state in *stream* is inconsistent or inappropriate.
- *stream* is `NULL`.

deflateInit2_

Name

deflateInit2_ — initialize compression system

Synopsis

```
#include <zlib.h>
int deflateInit2_ (z_streamp strm, int level, int method, int
windowBits, int memLevel, int strategy, char * version, int stream_size);
```

Description

The `deflateInit2_()` function shall initialize the compression system. On entry, *strm* shall refer to a user supplied `z_stream` object (a `z_stream_s` structure). The following fields shall be set on entry:

zalloc

a pointer to an `alloc_func` function, used to allocate state information. If this is `NULL`, a default allocation function will be used.

zfree

a pointer to a `free_func` function, used to free memory allocated by the *zalloc* function. If this is `NULL` a default free function will be used.

opaque

If *alloc_func* is not `NULL`, *opaque* is a user supplied pointer to data that will be passed to the *alloc_func* and *free_func* functions.

If the *version* requested is not compatible with the version implemented, or if the size of the `z_stream_s` structure provided in *stream_size* does not match the size in the library implementation, `deflateInit2_()` shall fail, and return `Z_VERSION_ERROR`.

The *level* supplied shall be a value between 0 and 9, or the value `Z_DEFAULT_COMPRESSION`. A *level* of 1 requests the highest speed, while a *level* of 9 requests the highest compression. A *level* of 0 indicates that no compression should be used, and the output shall be the same as the input.

The *method* selects the compression algorithm to use. LSB conforming implementation shall support the `Z_DEFLATED` method, and may support other implementation defined methods.

The *windowBits* parameter shall be a base 2 logarithm of the window size to use, and shall be a value between 8 and 15. A smaller value will use less memory, but will result in a poorer compression ratio, while a higher value will give better compression but utilize more memory.

The *memLevel* parameter specifies how much memory to use for the internal state. The value of *memLevel* shall be between 1 and `MAX_MEM_LEVEL`. Smaller values use less memory but are slower, while higher values use more memory to gain compression speed.

The *strategy* parameter selects the compression strategy to use:

`Z_DEFAULT_STRATEGY`

use the system default compression strategy. `Z_DEFAULT_STRATEGY` is particularly appropriate for text data.

`Z_FILTERED`

use a compression strategy tuned for data consisting largely of small values with a fairly random distribution. `Z_FILTERED` uses more Huffman encoding and less string matching than `Z_DEFAULT_STRATEGY`.

`Z_HUFFMAN_ONLY`

force Huffman encoding only, with no string match.

The `deflateInit2_()` function is not in the source standard; it is only in the binary standard. Source applications should use the `deflateInit2()` macro.

Return Value

On success, the `deflateInit2_()` function shall return `Z_OK`. Otherwise, `deflateInit2_()` shall return a value as described below to indicate the error.

Errors

On error, `deflateInit2_()` shall return one of the following error indicators:

`Z_STREAM_ERROR`

Invalid parameter.

`Z_MEM_ERROR`

Insufficient memory available.

`Z_VERSION_ERROR`

The version requested is not compatible with the library version, or the `z_stream` size differs from that used by the library.

In addition, the `msg` field of the `stream` may be set to an error message.

deflateInit_

Name

deflateInit_ — initialize compression system

Synopsis

```
#include <zlib.h>
int deflateInit_(z_streamp stream, int level, const char * version,
int stream_size);
```

Description

The deflateInit_() function shall initialize the compression system. On entry, *stream* shall refer to a user supplied z_stream object (a z_stream_s structure). The following fields shall be set on entry:

zalloc

a pointer to an alloc_func function, used to allocate state information. If this is NULL, a default allocation function will be used.

zfree

a pointer to a free_func function, used to free memory allocated by the *zalloc* function. If this is NULL a default free function will be used.

opaque

If *alloc_func* is not NULL, *opaque* is a user supplied pointer to data that will be passed to the *alloc_func* and *free_func* functions.

If the *version* requested is not compatible with the version implemented, or if the size of the z_stream_s structure provided in *stream_size* does not match the size in the library implementation, deflateInit_() shall fail, and return Z_VERSION_ERROR.

The *level* supplied shall be a value between 0 and 9, or the value Z_DEFAULT_COMPRESSION. A *level* of 1 requests the highest speed, while a *level* of 9 requests the highest compression. A *level* of 0 indicates that no compression should be used, and the output shall be the same as the input.

The deflateInit_() function is not in the source standard; it is only in the binary standard. Source applications should use the deflateInit() macro.

The deflateInit_() function is equivalent to

```
deflateInit2_(stream, level, Z_DEFLATED, MAX_WBITS, MAX_MEM_LEVEL,
```

```
z_DEFAULT_STRATEGY, version, stream_size);
```

Return Value

On success, the `deflateInit_()` function shall return `Z_OK`. Otherwise, `deflateInit_()` shall return a value as described below to indicate the error.

Errors

On error, `deflateInit_()` shall return one of the following error indicators:

`Z_STREAM_ERROR`

Invalid parameter.

`Z_MEM_ERROR`

Insufficient memory available.

`Z_VERSION_ERROR`

The version requested is not compatible with the library version, or the `z_stream` size differs from that used by the library.

In addition, the `msg` field of the `stream` may be set to an error message.

deflateParams

Name

deflateParams — set compression parameters

Synopsis

```
#include <zlib.h>
int deflateParams(z_streamp stream, int level, int strategy);
```

Description

The `deflateParams()` function shall dynamically alter the compression parameters for the compression stream object *stream*. On entry, *stream* shall refer to a user supplied `z_stream` object (a `z_stream_s` structure), already initialized via a call to `deflateInit_()` or `deflateInit2_()`.

The *level* supplied shall be a value between 0 and 9, or the value `Z_DEFAULT_COMPRESSION`. A *level* of 1 requests the highest speed, while a *level* of 9 requests the highest compression. A *level* of 0 indicates that no compression should be used, and the output shall be the same as the input. If the compression level is altered by `deflateParams()`, and some data has already been compressed with this *stream* (i.e. *total_in* is not zero), and the new *level* requires a different underlying compression method, then *stream* shall be flushed by a call to `deflate()`.

The *strategy* parameter selects the compression strategy to use:

`Z_DEFAULT_STRATEGY`

use the system default compression strategy. `Z_DEFAULT_STRATEGY` is particularly appropriate for text data.

`Z_FILTERED`

use a compression strategy tuned for data consisting largely of small values with a fairly random distribution. `Z_FILTERED` uses more Huffman encoding and less string matching than `Z_DEFAULT_STRATEGY`.

`Z_HUFFMAN_ONLY`

force Huffman encoding only, with no string match.

Return Value

On success, the `deflateParams()` function shall return `Z_OK`. Otherwise, `deflateParams()` shall return a value as described below to indicate the error.

Errors

On error, `deflateParams()` shall return one of the following error indicators:

`Z_STREAM_ERROR`

Invalid parameter.

`Z_MEM_ERROR`

Insufficient memory available.

Z_BUF_ERROR

Insufficient space in *stream* to flush the current output.

In addition, the *msg* field of the *strm* may be set to an error message.

Application Usage (Informative)

Applications should ensure that the *stream* is flushed, e.g. by a call to **deflate(stream, Z_SYNC_FLUSH)** before calling `deflateParams()`, or ensure that there is sufficient space in *next_out* (as identified by *avail_out*) to ensure that all pending output and all uncompressed input can be flushed in a single call to `deflate()`.

Rationale: Although the `deflateParams()` function should flush pending output and compress all pending input, the result is unspecified if there is insufficient space in the output buffer. Applications should only call `deflateParams()` when the *stream* is effectively empty (flushed).

The `deflateParams()` can be used to switch between compression and straight copy of the input data, or to switch to a different kind of input data requiring a different strategy.

deflateReset

Name

`deflateReset` — reset compression stream state

Synopsis

```
#include <zlib.h>
int deflateReset(z_streamp stream);
```

Description

The `deflateReset()` function shall reset all state associated with *stream*. All pending output shall be discarded, and the counts of processed bytes (*total_in* and *total_out*) shall be reset to zero.

Return Value

On success, `deflateReset()` shall return `Z_OK`. Otherwise it shall return `Z_STREAM_ERROR` to indicate the error.

Errors

On error, `deflateReset()` shall return `Z_STREAM_ERROR`. The following conditions shall be treated as an error:

- The state in *stream* is inconsistent or inappropriate.
- *stream* is `NULL`.

deflateSetDictionary

Name

deflateSetDictionary — initialize compression dictionary

Synopsis

```
#include <zlib.h>
int deflateSetDictionary(z_stream * stream, const Bytef * dictionary,
    uInt dictlen);
```

Description

The `deflateSetDictionary()` function shall initialize the compression dictionary associated with *stream* using the *dictlen* bytes referenced by *dictionary*.

The implementation may silently use a subset of the provided dictionary if the dictionary cannot fit in the current window associated with *stream* (see `deflateInit2_()`). The application should ensure that the dictionary is sorted such that the most commonly used strings occur at the end of the dictionary.

If the dictionary is successfully set, the Adler32 checksum of the entire provided dictionary shall be stored in the *adler* member of *stream*. This value may be used by the decompression system to select the correct dictionary. The compression and decompression systems must use the same dictionary.

stream shall reference an initialized compression stream, with *total_in* zero (i.e. no data has been compressed since the stream was initialized).

Return Value

On success, `deflateSetDictionary()` shall return `Z_OK`. Otherwise it shall return `Z_STREAM_ERROR` to indicate an error.

Errors

On error, `deflateSetDictionary()` shall return a value as described below:

`Z_STREAM_ERROR`

The state in *stream* is inconsistent, or *stream* was `NULL`.

Application Usage (informative)

The application should provide a dictionary consisting of strings {{{ed note: do we really mean "strings"? Null terminated?}}} that are likely to be encountered in the data to be compressed. The application should ensure that the dictionary is sorted such that the most commonly used strings occur at the end of the dictionary.

The use of a dictionary is optional; however if the data to be compressed is relatively short and has a predictable structure, the use of a dictionary can substantially improve the compression ratio.

get_crc_table**Name**

`get_crc_table` — generate a table for crc calculations

Synopsis

```
#include <zlib.h>
const uLongf * get_crc_table(void);
```

Description

Generate tables for a byte-wise 32-bit CRC calculation based on the polynomial:
 $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$

In a multi-threaded application, `get_crc_table()` should be called by one thread to initialize the tables before any other thread calls any `libz` function.

Return Value

The `get_crc_table()` function shall return a pointer to the first of a set of tables used internally to calculate CRC-32 values (see `crc32()`).

Errors

None defined.

gzclose

Name

gzclose — close a compressed file stream

Synopsis

```
#include <zlib.h>
int gzclose (gzFile file );
```

Description

The `gzclose()` function shall close the compressed file stream *file*. If *file* was open for writing, `gzclose()` shall first flush any pending output. Any state information allocated shall be freed.

Return Value

On success, `gzclose()` shall return `Z_OK`. Otherwise, `gzclose()` shall return an error value as described below.

Errors

On error, `gzclose()` may set the global variable `errno` to indicate the error. The `gzclose()` shall return a value other than `Z_OK` on error.

`Z_STREAM_ERROR`

file was `NULL` (or `Z_NULL`), or did not refer to an open compressed file stream.

`Z_ERRNO`

An error occurred in the underlying base libraries, and the application should check `errno` for further information.

`Z_BUF_ERROR`

no compression progress is possible during buffer flush (see `deflate()`).

gzdopen

Name

gzdopen — open a compressed file

Synopsis

```
#include <zlib.h>
gzFile gzdopen ( int fd, const char *mode );
```

Description

The `gzdopen()` function shall attempt to associate the open file referenced by *fd* with a `gzFile` object. The *mode* argument is based on that of `fopen()`, but the *mode* parameter may also contain the following characters:

digit

set the compression level to *digit*. A low value (e.g. 1) means high speed, while a high value (e.g. 9) means high compression. A compression level of 0 (zero) means no compression. See `deflateInit2_()` for further details.

[fhR]

set the compression strategy to *[fhR]*. The letter *f* corresponds to filtered data, the letter *h* corresponds to Huffman only compression, and the letter *R* corresponds to Run Length Encoding. See `deflateInit2_()` for further details.

If *fd* refers to an uncompressed file, and *mode* refers to a read mode, `gzdopen()` shall attempt to open the file and return a `gzFile` object suitable for reading directly from the file without any decompression.

If *mode* is `NULL`, or if *mode* does not contain one of *r*, *w*, or *a*, `gzdopen()` shall return `Z_NULL`, and need not set any other error condition.

Example

```
gzdopen(fileno(stdin), "r");
```

Attempt to associate the standard input with a `gzFile` object.

Return Value

On success, `gzdopen()` shall return a `gzFile` object. On failure, `gzdopen()` shall return `Z_NULL` and may set `errno` accordingly.

Note: At version 1.2.2, `zlib` does not set `errno` for several error conditions. Applications may not be able to determine the cause of an error.

Errors

On error, `gzdopen()` may set the global variable `errno` to indicate the error.

gzeof**Name**

`gzeof` — check for end-of-file on a compressed file stream

Synopsis

```
#include <zlib.h>
int gzeof (gzFile file );
```

Description

The `gzeof()` function shall test the compressed file stream *file* for end of file.

Return Value

If *file* was open for reading and end of file has been reached, `gzeof()` shall return 1. Otherwise, `gzeof()` shall return 0.

Errors

None defined.

gzerror

Name

`gzerror` — decode an error on a compressed file stream

Synopsis

```
#include <zlib.h>
const char * gzerror (gzFile file, int * errnum);
```

Description

The `gzerror()` function shall return a string describing the last error to have occurred associated with the open compressed file stream referred to by *file*. It shall also set the location referenced by *errnum* to an integer value that further identifies the error.

Return Value

The `gzerror()` function shall return a string that describes the last error associated with the given *file* compressed file stream. This string shall have the format "*%s*: *%s*", with the name of the file, followed by a colon, a space, and the description of the error. If the compressed file stream was opened by a call to `gzdopen()`, the format of the filename is unspecified.

Rationale: Although in all current implementations of libz file descriptors are named "<fd:%d>", the code suggests that this is for debugging purposes only, and may change in a future release.

It is unspecified if the string returned is determined by the setting of the `LC_MESSAGES` category in the current locale.

Errors

None defined.

gzflush

Name

gzflush — flush a compressed file stream

Synopsis

```
#include <zlib.h>
int gzflush(gzFile file, int flush);
```

Description

The `gzflush()` function shall flush pending output to the compressed file stream identified by *file*, which must be open for writing.

Flush Operation

The parameter *flush* determines which compressed bits are added to the output file. If *flush* is `Z_NO_FLUSH`, `gzflush()` may return with some data pending output, and not yet written to the file.

If *flush* is `Z_SYNC_FLUSH`, `gzflush()` shall flush all pending output to *file* and align the output to a byte boundary. There may still be data pending compression that is not flushed.

If *flush* is `Z_FULL_FLUSH`, all output shall be flushed, as for `Z_SYNC_FLUSH`, and the compression state shall be reset. There may still be data pending compression that is not flushed.

Rationale: `Z_SYNC_FLUSH` is intended to ensure that the compressed data contains all the data compressed so far, and allows a decompressor to reconstruct all of the input data. `Z_FULL_FLUSH` allows decompression to restart from this point if the previous compressed data has been lost or damaged. Flushing is likely to degrade the performance of the compression system, and should only be used where necessary.

If *flush* is set to `Z_FINISH`, all pending uncompressed data shall be compressed and all output shall be flushed.

Return Value

On success, `gzflush()` shall return the value `Z_OK`. Otherwise `gzflush()` shall return a value to indicate the error, and may set the error number associated with the compressed file stream *file*.

Note: If *flush* is set to `Z_FINISH` and the flush operation is successful, `gzflush()` will return `Z_OK`, but the compressed file stream error value may be set to `Z_STREAM_END`.

Errors

On error, `gzflush()` shall return an error value, and may set the error number associated with the stream identified by *file* to indicate the error. Applications may use `gzerror()` to access this error value.

`Z_ERRNO`

An underlying base library function has indicated an error. The global variable `errno` may be examined for further information.

Z_STREAM_ERROR

The stream is invalid, is not open for writing, or is in an invalid state.

Z_BUF_ERROR

no compression progress is possible (see `deflate()`).

Z_MEM_ERROR

Insufficient memory available to compress.

gzgetc

Name

`gzgetc` — read a character from a compressed file

Synopsis

```
#include <zlib.h>
int gzgetc (gzFile file);
```

Description

The `gzgetc()` function shall read the next single character from the compressed file stream referenced by *file*, which shall have been opened in a read mode (see `gzopen()` and `gzdopen()`).

Return Value

On success, `gzgetc()` shall return the uncompressed character read, otherwise, on end of file or error, `gzgetc()` shall return -1.

Errors

On end of file or error, `gzgetc()` shall return -1. Further information can be found by calling `gzerror()` with a pointer to the compressed file stream.

gzgets

Name

gzgets — read a string from a compressed file

Synopsis

```
#include <zlib.h>
char * gzgets (gzFile file, char * buf, int len);
```

Description

The `gzgets()` function shall attempt to read data from the compressed file stream *file*, uncompressing it into *buf* until either *len*-1 bytes have been inserted into *buf*, or until a newline character has been uncompressed into *buf*. A null byte shall be appended to the uncompressed data. The *file* shall have been opened in for reading (see `gzopen()` and `gzdopen()`).

Return Value

On success, `gzgets()` shall return a pointer to *buf*. Otherwise, `gzgets()` shall return `Z_NULL`. Applications may examine the cause using `gzerror()`.

Errors

On error, `gzgets()` shall return `Z_NULL`. The following conditions shall always be treated as an error:

- file* is `NULL`, or does not refer to a file open for reading;
- buf* is `NULL`;
- len* is less than or equal to zero.

gzopen

Name

gzopen — open a compressed file

Synopsis

```
#include <zlib.h>
gzFile gzopen (const char *path , const char *mode );
```

Description

The `gzopen()` function shall open the compressed file named by *path*. The *mode* argument is based on that of `fopen()`, but the *mode* parameter may also contain the following characters:

digit

set the compression level to *digit*. A low value (e.g. 1) means high speed, while a high value (e.g. 9) means high compression. A compression level of 0 (zero) means no compression. See `deflateInit2_()` for further details.

[fhR]

set the compression strategy to *[fhR]*. The letter *f* corresponds to filtered data, the letter *h* corresponds to Huffman only compression, and the letter *R* corresponds to Run Length Encoding. See `deflateInit2_()` for further details.

If *path* refers to an uncompressed file, and *mode* refers to a read mode, `gzopen()` shall attempt to open the file and return a `gzFile` object suitable for reading directly from the file without any decompression.

If *path* or *mode* is `NULL`, or if *mode* does not contain one of *r*, *w*, or *a*, `gzopen()` shall return `Z_NULL`, and need not set any other error condition.

The `gzFile` object is also referred to as a compressed file stream.

Example

```
gzopen("file.gz", "w6h");
```

Attempt to create a new compressed file, `file.gz`, at compression level 6 using Huffman only compression.

Return Value

On success, `gzopen()` shall return a `gzFile` object (also known as a *compressed file stream*). On failure, `gzopen()` shall return `Z_NULL` and may set `errno` accordingly.

Note: At version 1.2.2, `zlib` does not set `errno` for several error conditions. Applications may not be able to determine the cause of an error.

Errors

On error, `gzopen()` may set the global variable `errno` to indicate the error.

gzprintf

Name

gzprintf — format data and compress

Synopsis

```
#include <zlib.h>
int gzprintf (gzFile file, const char * fmt, ...);
```

Description

The `gzprintf()` function shall format data as for `fprintf()`, and write the resulting string to the compressed file stream *file*.

Return Value

The `gzprintf()` function shall return the number of uncompressed bytes actually written, or a value less than or equal to 0 in the event of an error.

Errors

If *file* is `NULL`, or refers to a compressed file stream that has not been opened for writing, `gzprintf()` shall return `Z_STREAM_ERROR`. Otherwise, errors are as for `gzwrite()`.

gzputc

Name

gzputc — write character to a compressed file

Synopsis

```
#include <zlib.h>
int gzputc (gzFile file, int c);
```

Description

The `gzputc()` function shall write the single character *c*, converted from integer to unsigned character, to the compressed file referenced by *file*, which shall have been opened in a write mode (see `gzopen()` and `gzdopen()`).

Return Value

On success, `gzputc()` shall return the value written, otherwise `gzputc()` shall return -1.

Errors

On error, `gzputc()` shall return -1.

gzputs

Name

gzputs — string write to a compressed file

Synopsis

```
#include <zlib.h>
int gzputs (gzFile file, const char * s);
```

Description

The `gzputs()` function shall write the null terminated string *s* to the compressed file referenced by *file*, which shall have been opened in a write mode (see `gzopen()` and `gzdopen()`). The terminating null character shall not be written. The `gzputs()` function shall return the number of uncompressed bytes actually written.

Return Value

On success, `gzputs()` shall return the number of uncompressed bytes actually written to *file*. On error `gzputs()` shall return a value less than or equal to 0. Applications may examine the cause using `gzerror()`.

Errors

On error, `gzputs()` shall set the error number associated with the stream identified by *file* to indicate the error. Applications should use `gzerror()` to access this error value. If *file* is NULL, `gzputs()` shall return `Z_STREAM_ERR`.

`Z_ERRNO`

An underlying base library function has indicated an error. The global variable `errno` may be examined for further information.

`Z_STREAM_ERROR`

The stream is invalid, is not open for writing, or is in an invalid state.

`Z_BUF_ERROR`

no compression progress is possible (see `deflate()`).

`Z_MEM_ERROR`

Insufficient memory available to compress.

gzread

Name

gzread — read from a compressed file

Synopsis

```
#include <zlib.h>
int gzread (gzFile file, voidp buf, unsigned int len);
```

Description

The `gzread()` function shall read data from the compressed file referenced by *file*, which shall have been opened in a read mode (see `gzopen()` and `gzdopen()`). The `gzread()` function shall read data from *file*, and uncompress it into *buf*. At most, *len* bytes of uncompressed data shall be copied to *buf*. If the file is not compressed, `gzread()` shall simply copy data from *file* to *buf* without alteration.

Return Value

On success, `gzread()` shall return the number of bytes decompressed into *buf*. If `gzread()` returns 0, either the end-of-file has been reached or an underlying read error has occurred. Applications should use `gzerror()` or `gzeof()` to determine which occurred. On other errors, `gzread()` shall return a value less than 0 and applications may examine the cause using `gzerror()`.

Errors

On error, `gzread()` shall set the error number associated with the stream identified by *file* to indicate the error. Applications should use `gzerror()` to access this error value.

Z_ERRNO

An underlying base library function has indicated an error. The global variable `errno` may be examined for further information.

Z_STREAM_END

End of file has been reached on input.

Z_DATA_ERROR

A CRC error occurred when reading data; the file is corrupt.

Z_STREAM_ERROR

The stream is invalid, or is in an invalid state.

Z_NEED_DICT

A dictionary is needed (see `inflateSetDictionary()`).

Z_MEM_ERROR

Insufficient memory available to decompress.

gzrewind

Name

gzrewind — reset the file-position indicator on a compressed file stream

Synopsis

```
#include <zlib.h>
int gzrewind(gzFile file);
```

Description

The `gzrewind()` function shall set the starting position for the next read on compressed file stream *file* to the beginning of file. *file* must be open for reading.

`gzrewind()` is equivalent to

```
(int)gzseek(file, 0L, SEEK_SET)
```

.

Return Value

On success, `gzrewind()` shall return 0. On error, `gzrewind()` shall return -1, and may set the error value for *file* accordingly.

Errors

On error, `gzrewind()` shall return -1, indicating that *file* is NULL, or does not represent an open compressed file stream, or represents a compressed file stream that is open for writing and is not currently at the beginning of file.

gzseek

Name

`gzseek` — reposition a file-position indicator in a compressed file stream

Synopsis

```
#include <zlib.h>
z_off_t gzseek(gzFile file, z_off_t offset, int whence);
```

Description

The `gzseek()` function shall set the file-position indicator for the compressed file stream *file*. The file-position indicator controls where the next read or write operation on the compressed file stream shall take place. The *offset* indicates a byte offset in the uncompressed data. The *whence* parameter may be one of:

`SEEK_SET`

the offset is relative to the start of the uncompressed data.

`SEEK_CUR`

the offset is relative to the current position in the uncompressed data.

Note: The value `SEEK_END` need not be supported.

If the *file* is open for writing, the new offset must be greater than or equal to the current offset. In this case, `gzseek()` shall compress a sequence of null bytes to fill the gap from the previous offset to the new offset.

Return Value

On success, `gzseek()` shall return the resulting offset in the file expressed as a byte position in the *uncompressed* data stream. On error, `gzseek()` shall return -1, and may set the error value for *file* accordingly.

Errors

On error, `gzseek()` shall return -1. The following conditions shall always result in an error:

- *file* is `NULL`
- *file* does not represent an open compressed file stream.
- *file* refers to a compressed file stream that is open for writing, and the newly computed offset is less than the current offset.
- The newly computed offset is less than zero.
- *whence* is not one of the supported values.

Application Usage (informative)

If *file* is open for reading, the implementation may still need to uncompress all of the data up to the new offset. As a result, `gzseek()` may be extremely slow in some circumstances.

gzsetparams

Name

gzsetparams — dynamically set compression parameters

Synopsis

```
#include <zlib.h>
int gzsetparams (gzFile file, int level, int strategy);
```

Description

The `gzsetparams()` function shall set the compression level and compression strategy on the compressed file stream referenced by *file*. The compressed file stream shall have been opened in a write mode. The *level* and *strategy* are as defined in `deflateInit2`.. If there is any data pending writing, it shall be flushed before the parameters are updated.

Return Value

On success, the `gzsetparams()` function shall return `Z_OK`.

Errors

On error, `gzsetparams()` shall return one of the following error indications:

`Z_STREAM_ERROR`

Invalid parameter, or *file* not open for writing.

`Z_BUF_ERROR`

An internal inconsistency was detected while flushing the previous buffer.

gztell

Name

gztell — find position on a compressed file stream

Synopsis

```
#include <zlib.h>
z_off_t gztell (gzFile file );
```

Description

The `gztell()` function shall return the starting position for the next read or write operation on compressed file stream *file*. This position represents the number of bytes from the beginning of file in the uncompressed data.

`gztell()` is equivalent to

```
gzseek(file, 0L, SEEK_CUR)
```

.

Return Value

`gztell()` shall return the current offset in the file expressed as a byte position in the *uncompressed* data stream. On error, `gztell()` shall return -1, and may set the error value for *file* accordingly.

Errors

On error, `gztell()` shall return -1, indicating that *file* is NULL, or does not represent an open compressed file stream.

gzwrite

Name

gzwrite — write to a compressed file

Synopsis

```
#include <zlib.h>
int gzwrite (gzFile file, voidpc buf, unsigned int len);
```

Description

The `gzwrite()` function shall write data to the compressed file referenced by *file*, which shall have been opened in a write mode (see `gzopen()` and `gzdopen()`). On entry, *buf* shall point to a buffer containing *len* bytes of uncompressed data. The `gzwrite()` function shall compress this data and write it to *file*. The `gzwrite()` function shall return the number of uncompressed bytes actually written.

Return Value

On success, `gzwrite()` shall return the number of uncompressed bytes actually written to *file*. On error `gzwrite()` shall return a value less than or equal to 0. Applications may examine the cause using `gzerror()`.

Errors

On error, `gzwrite()` shall set the error number associated with the stream identified by *file* to indicate the error. Applications should use `gzerror()` to access this error value.

Z_ERRNO

An underlying base library function has indicated an error. The global variable `errno` may be examined for further information.

Z_STREAM_ERROR

The stream is invalid, is not open for writing, or is in an invalid state.

Z_BUF_ERROR

no compression progress is possible (see `deflate()`).

Z_MEM_ERROR

Insufficient memory available to compress.

inflate

Name

inflate — decompress data

Synopsis

```
#include <zlib.h>
int inflate(z_streamp stream, int flush);
```

Description

The `inflate()` function shall attempt to decompress data until either the input buffer is empty or the output buffer is full. The *stream* references a `z_stream` structure. Before the first call to `inflate()`, this structure should have been initialized by a call to `inflateInit2_()`.

Note: `inflateInit2_()` is only in the binary standard; source level applications should initialize *stream* via a call to `inflateInit()` or `inflateInit2()`.

In addition, the *stream* input and output buffers should have been initialized as follows:

next_in

should point to the data to be decompressed.

avail_in

should contain the number of bytes of data in the buffer referenced by *next_in*.

next_out

should point to a buffer where decompressed data may be placed.

avail_out

should contain the size in bytes of the buffer referenced by *next_out*

The `inflate()` function shall perform one or both of the following actions:

1. Decompress input data from *next_in* and update *next_in*, *avail_in* and *total_in* to reflect the data that has been decompressed.
2. Fill the output buffer referenced by *next_out*, and update *next_out*, *avail_out*, and *total_out* to reflect the decompressed data that has been placed there. If *flush* is not `Z_NO_FLUSH`, and *avail_out* indicates that there is still space in output buffer, this action shall always occur (see below for further details).

The `inflate()` function shall return when either *avail_in* reaches zero (indicating that all the input data has been compressed), or *avail_out* reaches zero (indicating that the output buffer is full).

Flush Operation

The parameter *flush* determines when uncompressed bytes are added to the output buffer in *next_out*. If *flush* is `Z_NO_FLUSH`, `inflate()` may return with some data pending output, and not yet added to the output buffer.

If *flush* is `Z_SYNC_FLUSH`, `inflate()` shall flush all pending output to *next_out*, and update *next_out* and *avail_out* accordingly.

If *flush* is set to `Z_BLOCK`, `inflate()` shall stop adding data to the output buffer if and when the next compressed block boundary is reached (see RFC 1951: DEFLATE Compressed Data Format Specification).

If *flush* is set to `Z_FINISH`, all of the compressed input shall be decompressed and added to the output. If there is insufficient output space (i.e. the compressed input data uncompresses to more than *avail_out* bytes), then `inflate()` shall fail and return `Z_BUF_ERROR`.

Return Value

On success, `inflate()` shall return `Z_OK` if decompression progress has been made, or `Z_STREAM_END` if all of the input data has been decompressed and there was sufficient space in the output buffer to store the uncompressed result. On error, `inflate()` shall return a value to indicate the error.

Note: If `inflate()` returns `Z_OK` and has set *avail_out* to zero, the function should be called again with the same value for *flush*, and with updated *next_out* and *avail_out* until `inflate()` returns with either `Z_OK` or `Z_STREAM_END` and a non-zero *avail_out*.

On success, `inflate()` shall set the *adler* to the Adler-32 checksum of the output produced so far (i.e. *total_out* bytes).

Errors

On error, `inflate()` shall return a value as described below, and may set the *msg* field of *stream* to point to a string describing the error:

`Z_BUF_ERROR`

No progress is possible; either *avail_in* or *avail_out* was zero.

`Z_MEM_ERROR`

Insufficient memory.

`Z_STREAM_ERROR`

The state (as represented in *stream*) is inconsistent, or *stream* was `NULL`.

`Z_NEED_DICT`

A preset dictionary is required. The *adler* field shall be set to the Adler-32 checksum of the dictionary chosen by the compressor.

inflateEnd

Name

inflateEnd — free decompression stream state

Synopsis

```
#include <zlib.h>
int inflateEnd(z_streamp stream);
```

Description

The `inflateEnd()` function shall free all allocated state information referenced by *stream*. All pending output is discarded, and unprocessed input is ignored.

Return Value

On success, `inflateEnd()` shall return `Z_OK`. Otherwise it shall return `Z_STREAM_ERROR` to indicate the error.

Errors

On error, `inflateEnd()` shall return `Z_STREAM_ERROR`. The following conditions shall be treated as an error:

- The state in *stream* is inconsistent.
- *stream* is `NULL`.
- The *zfree* function pointer is `NULL`.

inflateInit2_

Name

inflateInit2_ — initialize decompression system

Synopsis

```
#include <zlib.h>
int inflateInit2_ (z_streamp strm, int windowBits, char * version, int
stream_size);
```

Description

The `inflateInit2_()` function shall initialize the decompression system. On entry, *strm* shall refer to a user supplied `z_stream` object (a `z_stream_s` structure). The following fields shall be set on entry:

zalloc

a pointer to an `alloc_func` function, used to allocate state information. If this is `NULL`, a default allocation function will be used.

zfree

a pointer to a `free_func` function, used to free memory allocated by the *zalloc* function. If this is `NULL` a default free function will be used.

opaque

If *alloc_func* is not `NULL`, *opaque* is a user supplied pointer to data that will be passed to the *alloc_func* and *free_func* functions.

If the *version* requested is not compatible with the version implemented, or if the size of the `z_stream_s` structure provided in *stream_size* does not match the size in the library implementation, `inflateInit2_()` shall fail, and return `Z_VERSION_ERROR`.

The *windowBits* parameter shall be a base 2 logarithm of the maximum window size to use, and shall be a value between 8 and 15. If the input data was compressed with a larger window size, subsequent attempts to decompress this data will fail with `Z_DATA_ERROR`, rather than try to allocate a larger window.

The `inflateInit2_()` function is not in the source standard; it is only in the binary standard. Source applications should use the `inflateInit2()` macro.

Return Value

On success, the `inflateInit2_()` function shall return `Z_OK`. Otherwise, `inflateInit2_()` shall return a value as described below to indicate the error.

Errors

On error, `inflateInit2_()` shall return one of the following error indicators:

`Z_STREAM_ERROR`

Invalid parameter.

`Z_MEM_ERROR`

Insufficient memory available.

`Z_VERSION_ERROR`

The version requested is not compatible with the library version, or the `z_stream` size differs from that used by the library.

In addition, the *msg* field of the *stream* may be set to an error message.

inflateInit_

Name

inflateInit_ — initialize decompression system

Synopsis

```
#include <zlib.h>
int inflateInit_(z_streamp stream, const char * version, int
stream_size);
```

Description

The `inflateInit_()` function shall initialize the decompression system. On entry, *stream* shall refer to a user supplied `z_stream` object (a `z_stream_s` structure). The following fields shall be set on entry:

zalloc

a pointer to an `alloc_func` function, used to allocate state information. If this is `NULL`, a default allocation function will be used.

zfree

a pointer to a `free_func` function, used to free memory allocated by the *zalloc* function. If this is `NULL` a default free function will be used.

opaque

If *alloc_func* is not `NULL`, *opaque* is a user supplied pointer to data that will be passed to the *alloc_func* and *free_func* functions.

If the *version* requested is not compatible with the version implemented, or if the size of the `z_stream_s` structure provided in *stream_size* does not match the size in the library implementation, `inflateInit_()` shall fail, and return `Z_VERSION_ERROR`.

The `inflateInit_()` function is not in the source standard; it is only in the binary standard. Source applications should use the `inflateInit()` macro.

The `inflateInit_()` shall be equivalent to

```
inflateInit2_(strm, MAX_WBITS, version, stream_size);
```

Return Value

On success, the `inflateInit_()` function shall return `Z_OK`. Otherwise, `inflateInit_()` shall return a value as described below to indicate the error.

Errors

On error, `inflateInit_()` shall return one of the following error indicators:

`Z_STREAM_ERROR`

Invalid parameter.

`Z_MEM_ERROR`

Insufficient memory available.

`Z_VERSION_ERROR`

The version requested is not compatible with the library version, or the `z_stream` size differs from that used by the library.

In addition, the `msg` field of the `strm` may be set to an error message.

inflateReset

Name

`inflateReset` — reset decompression stream state

Synopsis

```
#include <zlib.h>
int inflateReset(z_streamp stream);
```

Description

The `inflateReset()` function shall reset all state associated with `stream`. All pending output shall be discarded, and the counts of processed bytes (`total_in` and `total_out`) shall be reset to zero.

Return Value

On success, `inflateReset()` shall return `Z_OK`. Otherwise it shall return `Z_STREAM_ERROR` to indicate the error.

Errors

On error, `inflateReset()` shall return `Z_STREAM_ERROR`. The following conditions shall be treated as an error:

- The state in `stream` is inconsistent or inappropriate.
- `stream` is `NULL`.

inflateSetDictionary

Name

inflateSetDictionary — initialize decompression dictionary

Synopsis

```
#include <zlib.h>
int inflateSetDictionary(z_stream * stream, const Bytef * dictionary,
    uInt dictlen);
```

Description

The `inflateSetDictionary()` function shall initialize the decompression dictionary associated with *stream* using the *dictlen* bytes referenced by *dictionary*.

The `inflateSetDictionary()` function should be called immediately after a call to `inflate()` has failed with return value `Z_NEED_DICT`. The *dictionary* must have the same Adler-32 checksum as the dictionary used for the compression (see `deflateSetDictionary()`).

stream shall reference an initialized decompression stream, with *total_in* zero (i.e. no data has been decompressed since the stream was initialized).

Return Value

On success, `inflateSetDictionary()` shall return `Z_OK`. Otherwise it shall return a value as indicated below.

Errors

On error, `inflateSetDictionary()` shall return a value as described below:

`Z_STREAM_ERROR`

The state in *stream* is inconsistent, or *stream* was `NULL`.

`Z_DATA_ERROR`

The Adler-32 checksum of the supplied dictionary does not match that used for the compression.

Application Usage (informative)

The application should provide a dictionary consisting of strings {{{ed note: do we really mean "strings"? Null terminated?}}} that are likely to be encountered in the data to be compressed. The application should ensure that the dictionary is sorted such that the most commonly used strings occur at the end of the dictionary.

The use of a dictionary is optional; however if the data to be compressed is relatively short and has a predictable structure, the use of a dictionary can substantially improve the compression ratio.

inflateSync

Name

inflateSync — advance compression stream to next sync point

Synopsis

```
#include <zlib.h>
int inflateSync(z_streamp stream);
```

Description

The `inflateSync()` function shall advance through the compressed data in *stream*, skipping any invalid compressed data, until the next full flush point is reached, or all input is exhausted. See the description for `deflate()` with flush level `Z_FULL_FLUSH`. No output is placed in *next_out*.

Return Value

On success, `inflateSync()` shall return `Z_OK`, and update the *next_in*, *avail_in*, and *total_in* fields of *stream* to reflect the number of bytes of compressed data that have been skipped. Otherwise, `inflateSync()` shall return a value as described below to indicate the error.

Errors

On error, `inflateSync()` shall return a value as described below:

`Z_STREAM_ERROR`

The state (as represented in *stream*) is inconsistent, or *stream* was `NULL`.

`Z_BUF_ERROR`

There is no data available to skip over.

`Z_DATA_ERROR`

No sync point was found.

inflateSyncPoint

Name

inflateSyncPoint — test for synchronization point

Synopsis

```
#include <zlib.h>
int inflateSyncPoint(z_streamp stream);
```

Description

The `inflateSyncPoint()` function shall return a non-zero value if the compressed data stream referenced by *stream* is at a synchronization point.

Return Value

If the compressed data in *stream* is at a synchronization point (see `deflate()` with a flush level of `Z_SYNC_FLUSH` or `Z_FULL_FLUSH`), `inflateSyncPoint()` shall return a non-zero value, other than `Z_STREAM_ERROR`. Otherwise, if the *stream* is valid, `inflateSyncPoint()` shall return 0. If *stream* is invalid, or in an invalid state, `inflateSyncPoint()` shall return `Z_STREAM_ERROR` to indicate the error.

Errors

On error, `inflateSyncPoint()` shall return a value as described below:

`Z_STREAM_ERROR`

The state (as represented in *stream*) is inconsistent, or *stream* was `NULL`.

uncompress

Name

uncompress — uncompress data

Synopsis

```
#include <zlib.h>
int uncompress(Bytef * dest, uLongf * destLen, const Bytef * source,
uLong sourceLen);
```

Description

The `uncompress()` function shall attempt to uncompress *sourceLen* bytes of data in the buffer *source*, placing the result in the buffer *dest*.

On entry, *destLen* should point to a value describing the size of the *dest* buffer. The application should ensure that this value is large enough to hold the entire uncompressed data.

Note: The LSB does not describe any mechanism by which a compressor can communicate the size required to the uncompressor.

On successful exit, the variable referenced by *destLen* shall be updated to hold the length of uncompressed data in *dest*.

Return Value

On success, `uncompress()` shall return `Z_OK`. Otherwise, `uncompress()` shall return a value to indicate the error.

Errors

On error, `uncompress()` shall return a value as described below:

`Z_BUF_ERROR`

The buffer *dest* was not large enough to hold the uncompressed data.

`Z_MEM_ERROR`

Insufficient memory.

`Z_DATA_ERROR`

The compressed data (referenced by *source*) was corrupted.

zError**Name**

`zError` — translate error number to string

Synopsis

```
#include <zlib.h>
const char * zError(int err);
```

Description

The `zError()` function shall return the string identifying the error associated with `err`. This allows for conversion from error code to string for functions such as `compress()` and `uncompress()`, that do not always set the string version of an error.

Return Value

The `zError()` function shall return a the string identifying the error associated with `err`, or NULL if `err` is not a valid error code.

It is unspecified if the string returned is determined by the setting of the `LC_MESSAGES` category in the current locale.

Errors

None defined.

zlibVersion**Name**

`zlibVersion` — discover library version at run time

Synopsis

```
#include <zlib.h>
const char * zlibVersion (void);
```

Description

The `zlibVersion()` function shall return the string identifying the interface version at the time the library was built.

Applications should compare the value returned from `zlibVersion()` with the macro constant `ZLIB_VERSION` for compatibility.

Return Value

The `zlibVersion()` function shall return a the string identifying the version of the library currently implemented.

Errors

None defined.

15.5 Interfaces for libncurses

Table 15-3 defines the library name and shared object name for the libncurses library

Table 15-3 libncurses Definition

Library:	libncurses
SONAME:	libncurses.so.5

The parameters or return types of the following interfaces have had the const qualifier added as shown here, as compared to the specification in X/Open Curses, Issue 7.

```
extern const char *keyname (int);
extern SCREEN *newterm (const char *, FILE *, FILE *);
extern const char *unctrl (chtype);

extern int mvprintw (int, int, const char *, ...);
extern int mvwprintw (WINDOW *, int, int, const char *, ...);
extern int printw (const char *, ...);
extern int vwprintw (WINDOW *, const char *, va_list);
extern int vw_printw (WINDOW *, const char *, va_list);
extern int wprintw (WINDOW *, const char *, ...);

extern int mvscanw (int, int, const char *, ...);
extern int mvwscanw (WINDOW *, int, int, const char *, ...);
extern int scanw (const char *, ...);
extern int vscanw (WINDOW *, const char *, va_list);
extern int vw_scanw (WINDOW *, const char *, va_list);
extern int wscanw (WINDOW *, const char *, ...);
```

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification
[X-CURSES] X/Open Curses, Issue 7

15.5.1 Curses

15.5.1.1 Interfaces for Curses

An LSB conforming implementation shall provide the generic functions for Curses specified in Table 15-4, with the full mandatory functionality as described in the referenced underlying specification.

15.6 Data Definitions for libncurses

This section defines global identifiers and their values that are associated with interfaces contained in libncurses. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

```

15.7 Interface Definitions for libncurses

The interfaces defined on the following pages are included in libncurses and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 15.5 shall behave as described in the referenced base document.

inchnstr

Name

`inchnstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int inchnstr(chtype * chstr, int n);
```

Description

The interface `inchnstr()` shall behave as specified in X/Open Curses, Issue 7, except that `inchnstr()` shall return the number of characters that were read.

inchstr

Name

`inchstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int inchstr(chtype * chstr);
```

Description

The interface `inchstr()` shall behave as specified in X/Open Curses, Issue 7, except that `inchstr()` shall return the number of characters that were read.

instr

Name

`instr` — obtain a string of characters from a curses window

Synopsis

```
#include <curses.h>
int instr(char * str);
```

Description

The interface `instr()` shall behave as specified in X/Open Curses, Issue 7, except that `instr()` shall return the number of characters that were read.

mvcur**Name**

`mvcur` — send cursor movement commands to terminal

Synopsis

```
#include <curses.h>
int mvcur(int oldrow, int oldcol, int newrow, int newcol);
```

Description

The interface `mvcur()` shall behave as described in X/Open Curses, Issue 7, except that if $(newrow, newcol)$ is not a valid address for the terminal in use, the results of the `mvcur()` function are unspecified.

mvinchstr**Name**

`mvinchstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int mvinchstr(int y, int x, chtype * chstr, int n);
```

Description

The interface `mvinchstr()` shall behave as specified in X/Open Curses, Issue 7, except that `mvinchstr()` shall return the number of characters that were read.

mvinchstr**Name**

`mvinchstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int mvinchstr(int y, int x, chtype * chstr);
```

Description

The interface `mvinchstr()` shall behave as specified in X/Open Curses, Issue 7, except that `mvinchstr()` shall return the number of characters that were read.

mvinstr

Name

`mvinstr` — obtain a string of characters from a curses window

Synopsis

```
#include <curses.h>
int mvinstr(int y, int x, char * str);
```

Description

The interface `mvinstr()` shall behave as specified in X/Open Curses, Issue 7, except that `mvinstr()` shall return the number of characters that were read.

mvscanw

Name

`mvscanw` — convert formatted input from a curses window

Synopsis

```
#include <curses.h>
int mvscanw(int y, int x, const char *fmt, ...);
```

Description

The `scanw` family of functions shall behave as described in X/Open Curses, Issue 7, except as noted below.

Differences

This function returns `ERR` on failure. On success it returns the number of successfully matched and assigned input items. This differs from X/Open Curses, Issue 7, which indicates this function returns `OK` on success.

mvwinchnstr

Name

`mvwinchnstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int mvwinchnstr(WINDOW * win, int y, int x, chtype * chstr, int n);
```

Description

The interface `mvwinchnstr()` shall behave as specified in X/Open Curses, Issue 7, except that `mvwinchnstr()` shall return the number of characters that were read.

mvwinchstr**Name**

`mvwinchstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int mvwinchstr(WINDOW * win, int y, int x, chtype * chstr);
```

Description

The interface `mvwinchstr()` shall behave as specified in X/Open Curses, Issue 7, except that `mvwinchstr()` shall return the number of characters that were read.

mvwinstr**Name**

`mvwinstr` — obtain a string of characters from a curses window

Synopsis

```
#include <curses.h>
int mvwinstr(WINDOW * win, int y, int x, char * str);
```

Description

The interface `mvwinstr()` shall behave as specified in X/Open Curses, Issue 7, except that `mvwinstr()` shall return the number of characters that were read.

mvwscanw**Name**

`mvwscanw` — convert formatted input from a curses window

Synopsis

```
#include <curses.h>
int mvwscanw(WINDOW *win, int y, int x, const char *fmt, ...);
```

Description

The `scanw` family of functions shall behave as described in X/Open Curses, Issue 7, except as noted below.

Differences

This function returns `ERR` on failure. On success it returns the number of successfully matched and assigned input items. This differs from X/Open Curses, Issue 7, which indicates this function returns `OK` on success.

riporffline**Name**

`riporffline` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int riporffline(int line, int (*init) (WINDOW *, int));
```

Description

The interface `riporffline()` shall behave as specified in X/Open Curses, Issue 7, except that `riporffline()` shall return `-1` if the number of lines that were ripped off exceeds five.

scanw**Name**

`scanw` — convert formatted input from a curses window

Synopsis

```
#include <curses.h>
int scanw(const char *fmt, ...);
```

Description

The `scanw` family of functions shall behave as described in X/Open Curses, Issue 7, except as noted below.

Differences

This function returns `ERR` on failure. On success it returns the number of successfully matched and assigned input items. This differs from X/Open Curses, Issue 7, which indicates this function returns `OK` on success.

vw_scanw**Name**

`vw_scanw` — convert formatted input from a curses window

Synopsis

```
#include <curses.h>
int vw_scanw(WINDOW *win, const char *fmt, va_list vararglist);
```

Description

The scanw family of functions shall behave as described in X/Open Curses, Issue 7, except as noted below.

Differences

This function returns `ERR` on failure. On success it returns the number of successfully matched and assigned input items. This differs from X/Open Curses, Issue 7, which indicates this function returns `OK` on success.

vwscanw**Name**

`vwscanw` — convert formatted input from a curses window

Synopsis

```
#include <curses.h>
int vw_scanw(WINDOW *win, const char *fmt, va_list vararglist);
```

Description

The scanw family of functions shall behave as described in X/Open Curses, Issue 7, except as noted below.

Differences

This function returns `ERR` on failure. On success it returns the number of successfully matched and assigned input items. This differs from X/Open Curses, Issue 7, which indicates this function returns `OK` on success.

winchnstr**Name**

`winchnstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int winchnstr(WINDOW * win, chtype * chstr, int n);
```

Description

The interface `winchnstr()` shall behave as specified in X/Open Curses, Issue 7, except that `winchnstr()` shall return the number of characters that were read.

winchstr**Name**

`winchstr` — obtain a string of characters and their attributes from a curses window

Synopsis

```
#include <curses.h>
int winchstr(WINDOW * win, chtype * chstr);
```

Description

The interface `winchstr()` shall behave as specified in X/Open Curses, Issue 7, except that `winchstr()` shall return the number of characters that were read.

winstr**Name**

`winstr` — obtain a string of characters from a curses window

Synopsis

```
#include <curses.h>
int winstr(WINDOW * win, char * str);
```

Description

The interface `winstr()` shall behave as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that `winstr()` shall return the number of characters that were read.

wscanw**Name**

wscanw — convert formatted input from a curses window

Synopsis

```
#include <curses.h>
int wscanw(WINDOW *win, const char *fmt, ...);
```

Description

The scanw family of functions shall behave as described in X/Open Curses, Issue 7, except as noted below.

Differences

This function returns `ERR` on failure. On success it returns the number of successfully matched and assigned input items. This differs from X/Open Curses, Issue 7, which indicates this function returns `OK` on success.

15.8 Interfaces for libncursesw

Table 15-7 defines the library name and shared object name for the libncursesw library

Table 15-7 libncursesw Definition

Library:	libncursesw
SONAME:	libncursesw.so.5

The behavior of the interfaces in this library is specified by the following specifications:

[Libncursesw] Libncursesw API
 [LSB] This Specification
 [ncursesw] Libncursesw Placeholder
 [X-CURSES] X/Open Curses, Issue 7

15.8.1 Curses Wide**15.8.1.1 Interfaces for Curses Wide**

An LSB conforming implementation shall provide the generic functions for Curses Wide specified in Table 15-8, with the full mandatory functionality as described in the referenced underlying specification.

stdscr [ncursesw]	ttytype [ncursesw]		

15.9 Data Definitions for libncursesw

This section defines global identifiers and their values that are associated with interfaces contained in libncursesw. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

15.9.1 ncursesw/curses.h

```

#define CURSES 1

15.10 Interface Definitions for libncursesw

The interfaces defined on the following pages are included in libncursesw and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 15.8 shall behave as described in the referenced base document.

15.11 Interfaces for libutil

Table 15-11 defines the library name and shared object name for the libutil library

Table 15-11 libutil Definition

Library:	libutil
SONAME:	libutil.so.1

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification

15.11.1 Utility Functions

15.11.1.1 Interfaces for Utility Functions

An LSB conforming implementation shall provide the generic functions for Utility Functions specified in Table 15-12, with the full mandatory functionality as described in the referenced underlying specification.

Table 15-12 libutil - Utility Functions Function Interfaces

forkpty [LSB]	login [LSB]	login_tty [LSB]	logout [LSB]
logwtmp [LSB]	openpty [LSB]		

15.12 Data Definitions for libutil

This section defines global identifiers and their values that are associated with interfaces contained in libutil. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

15.12.1 pty.h

```
extern int forkpty(int *__amaster, char *__name,
                  const struct termios *__termp,
                  const struct winsize *__winp);
extern int openpty(int *__amaster, int *__aslave, char *__name,
                  const struct termios *__termp,
                  const struct winsize *__winp);
```

15.13 Interface Definitions for libutil

The interfaces defined on the following pages are included in libutil and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 15.11 shall behave as described in the referenced base document.

forkpty

Name

`forkpty` — Create a new process attached to an available pseudo-terminal

Synopsis

```
#include <pty.h>
int forkpty(int * amaster, char * name, const struct termios * term,
const struct winsize * winp);
```

Description

The `forkpty()` function shall find and open a pseudo-terminal device pair in the same manner as the `openpty()` function. If a pseudo-terminal is available, `forkpty()` shall create a new process in the same manner as the `fork()` function, and prepares the new process for login in the same manner as `login_tty()`.

If `term` is not null, it shall refer to a `termios` structure that shall be used to initialize the characteristics of the slave device. If `winp` is not null, it shall refer to a `winsize` structure used to initialize the window size of the slave device.

Return Value

On success, the parent process shall return the process id of the child, and the child shall return 0. On error, no new process shall be created, -1 shall be returned, and `errno` shall be set appropriately. On success, the parent process shall receive the file descriptor of the master side of the pseudo-terminal in the location referenced by `amaster`, and, if `name` is not NULL, the filename of the slave device in `name`.

Errors

EAGAIN

Unable to create a new process.

ENOENT

There are no available pseudo-terminals.

ENOMEM

Insufficient memory was available.

login

Name

login — login utility function

Synopsis

```
#include <utmp.h>
void login (struct utmp * ut );
```

Description

The `login()` function shall update the user accounting databases. The `ut` parameter shall reference a `utmp` structure for all fields except the following:

1. The `ut_type` field shall be set to `USER_PROCESS`.
2. The `ut_pid` field shall be set to the process identifier for the current process.
3. The `ut_line` field shall be set to the name of the controlling terminal device. The name shall be found by examining the device associated with the standard input, output and error streams in sequence, until one associated with a terminal device is found. If none of these streams refers to a terminal device, the `ut_line` field shall be set to "???". If the terminal device is in the `/dev` directory hierarchy, the `ut_line` field shall not contain the leading `"/dev/"`, otherwise it shall be set to the final component of the pathname of the device. If the user accounting database imposes a limit on the size of the `ut_line` field, it shall truncate the name, but any such limit shall not be smaller than `UT_LINESIZE` (including a terminating null character).

Return Value

None

Errors

None

login_tty

Name

login_tty — Prepare a terminal for login

Synopsis

```
#include <utmp.h>
int login_tty (int fdx);
```

Description

The `login_tty()` function shall prepare the terminal device referenced by the file descriptor `fdx`. This function shall create a new session, make the terminal the controlling terminal for the current process, and set the standard input, output, and error streams of the current process to the terminal. If `fdx` is not the standard input, output or error stream, then `login_tty()` shall close `fdx`.

Return Value

On success, `login_tty()` shall return zero; otherwise -1 is returned, and `errno` shall be set appropriately.

Errors

ENOTTY

`fdx` does not refer to a terminal device.

logout

Name

logout — logout utility function

Synopsis

```
#include <utmp.h>
int logout (const char * line );
```

Description

Given the device `line`, the `logout()` function shall search the user accounting database which is read by `getutent()` for an entry with the corresponding line, and with the type of `USER_PROCESS`. If a corresponding entry is located, it shall be updated as follows:

1. The `ut_name` field shall be set to zeroes (`UT_NAMESIZE` NUL bytes).
2. The `ut_host` field shall be set to zeroes (`UT_HOSTSIZE` NUL bytes).
3. The `ut_tv` shall be set to the current time of day.
4. The `ut_type` field shall be set to `DEAD_PROCESS`.

Return Value

On success, the `logout()` function shall return non-zero. Zero is returned if there was no entry to remove, or if the `utmp` file could not be opened or updated.

logwtmp

Name

logwtmp — append an entry to the wtmp file

Synopsis

```
#include <utmp.h>
void logwtmp (const char * line , const char * name , const char *
host );
```

Description

If the process has permission to update the user accounting databases, the `logwtmp()` function shall append a record to the user accounting database that records all logins and logouts. The record to be appended shall be constructed as follows:

1. The `ut_line` field shall be initialized from *line*. If the user accounting database imposes a limit on the size of the `ut_line` field, it shall truncate the value, but any such limit shall not be smaller than `UT_LINESIZE` (including a terminating null character).
2. The `ut_name` field shall be initialized from *name*. If the user accounting database imposes a limit on the size of the `ut_name` field, it shall truncate the value, but any such limit shall not be smaller than `UT_NAMESIZE` (including a terminating null character).
3. The `ut_host` field shall be initialized from *host*. If the user accounting database imposes a limit on the size of the `ut_host` field, it shall truncate the value, but any such limit shall not be smaller than `UT_HOSTSIZE` (including a terminating null character).
4. If the *name* parameter does not refer to an empty string (i.e. ""), the `ut_type` field shall be set to `USER_PROCESS`; otherwise the `ut_type` field shall be set to `DEAD_PROCESS`.
5. The `ut_id` field shall be set to the process identifier for the current process.
6. The `ut_tv` field shall be set to the current time of day.

Note: If a process does not have write access to the the user accounting database, the `logwtmp()` function will not update it. Since the function does not return any value, an application has no way of knowing whether it succeeded or failed.

Return Value

None.

openpty

Name

openpty — find and open an available pseudo-terminal

Synopsis

```
#include <pty.h>
int openpty(int *amaster, int *aslave, char *name, const struct termios
*termp, const struct winsize *winp);
```

Description

The `openpty()` function shall find an available pseudo-terminal and return file descriptors for the master and slave devices in the locations referenced by *amaster* and *aslave* respectively. If *name* is not NULL, the filename of the slave shall be placed in the user supplied buffer referenced by *name*. If *termp* is not NULL, it shall point to a `termios` structure used to initialize the terminal parameters of the slave pseudo-terminal device. If *winp* is not NULL, it shall point to a `winsize` structure used to initialize the window size parameters of the slave pseudo-terminal device.

Return Value

On success, zero is returned. On error, -1 is returned, and `errno` is set appropriately.

Errors

ENOENT

There are no available pseudo-terminals.

V C++ Libraries

16 Libraries

An LSB-conforming implementation shall support some C++ libraries which provide interfaces for accessing the operating system, processor and other hardware in the system.

16.1 Interfaces for libstdc++

Table 16-1 defines the library name and shared object name for the libstdc++ library

Table 16-1 libstdc++ Definition

Library:	libstdc++
SONAME:	libstdc++.so.6

Unless stated otherwise, all symbols are in the `std::` namespace.

The behavior of the interfaces in this library is specified by the following specifications:

[CXXABI-1.86] Itanium™ C++ ABI
 [ISOCXX] ISO/IEC 14882: 2003 C++ Language
 [LSB] This Specification

16.1.1 C++ Runtime Support

16.1.1.1 Interfaces for C++ Runtime Support

An LSB conforming implementation shall provide the generic methods for C++ Runtime Support specified in Table 16-2, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-2 libstdc++ - C++ Runtime Support Function Interfaces

<code>__gnu_cxx::__atomic_add(int volatile*, int)</code> (GLIBCXX_3.4) [CXXABI-1.86]
<code>__gnu_cxx::__exchange_and_add(int volatile*, int)</code> (GLIBCXX_3.4) [CXXABI-1.86]

<code>__cxa_vec_new2(CXXABI_1.3)</code> [CXXABI-1.86]
<code>__cxa_vec_new3(CXXABI_1.3)</code> [CXXABI-1.86]
<code>__dynamic_cast(CXXABI_1.3)</code> [CXXABI-1.86]
<code>__gxx_personality_v0(CXXABI_1.3)</code> [CXXABI-1.86]

An LSB conforming implementation shall provide the generic data interfaces for C++ Runtime Support specified in Table 16-3, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-3 libstdc++ - C++ Runtime Support Data Interfaces

<code>cin(GLIBCXX_3.4)</code> [ISOCXX]
<code>cerr(GLIBCXX_3.4)</code> [ISOCXX]
<code>clog(GLIBCXX_3.4)</code> [ISOCXX]
<code>cout(GLIBCXX_3.4)</code> [ISOCXX]
<code>wcin(GLIBCXX_3.4)</code> [ISOCXX]
<code>wcerr(GLIBCXX_3.4)</code> [ISOCXX]
<code>wclog(GLIBCXX_3.4)</code> [ISOCXX]
<code>wcout(GLIBCXX_3.4)</code> [ISOCXX]
<code>nothrow(GLIBCXX_3.4)</code> [ISOCXX]

16.1.2 C++ type descriptors for built-in types

16.1.2.1 Interfaces for C++ type descriptors for built-in types

No external methods are defined for libstdc++ - C++ type descriptors for built-in types in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for C++ type descriptors for built-in types specified in Table 16-4, with the full mandatory functionality as described in the referenced underlying specification.

Name	typeinfo name for overflow_error

16.1.29.2 Interfaces for Class overflow_error

An LSB conforming implementation shall provide the generic methods for Class std::overflow_error specified in Table 16-97, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-97 libstdcxx - Class overflow_error Function Interfaces

overflow_error::overflow_error(basic_string<char, char_traits<char>, allocator<char> > const&)(GLIBCXX_3.4) [ISOCXX]
overflow_error::overflow_error(basic_string<char, char_traits<char>, allocator<char> > const&)(GLIBCXX_3.4) [ISOCXX]
overflow_error::~~overflow_error()(GLIBCXX_3.4) [ISOCXX]
overflow_error::~~overflow_error()(GLIBCXX_3.4) [ISOCXX]

An LSB conforming implementation shall provide the generic data interfaces for Class std::overflow_error specified in Table 16-98, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-98 libstdcxx - Class overflow_error Data Interfaces

typeinfo for overflow_error(GLIBCXX_3.4) [CXXABI-1.86]
typeinfo name for overflow_error(GLIBCXX_3.4) [CXXABI-1.86]
vtable for overflow_error(GLIBCXX_3.4) [CXXABI-1.86]

16.1.30 Class `underflow_error`

16.1.30.1 Class data for `underflow_error`

The virtual table for the `std::underflow_error` class is described by Table 16-99

Table 16-99 Primary vtable for `underflow_error`

Base Offset	0
Virtual Base Offset	0
RTTI	<code>typeinfo</code> for <code>underflow_error</code>
<code>vfunc[0]:</code>	<code>underflow_error::~~underflow_error()</code>
<code>vfunc[1]:</code>	<code>underflow_error::~~underflow_error()</code>
<code>vfunc[2]:</code>	<code>runtime_error::what() const</code>

The Run Time Type Information for the `std::underflow_error` class is described by Table 16-100

Table 16-100 `typeinfo` for `underflow_error`

Base Vtable	vtable for <code>__cxxabiv1::__si_class_type_info</code>
Name	<code>typeinfo</code> name for <code>underflow_error</code>

16.1.30.2 Interfaces for Class `underflow_error`

An LSB conforming implementation shall provide the generic methods for Class `std::underflow_error` specified in Table 16-101, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-101 `libstdcxx` - Class `underflow_error` Function Interfaces

<code>underflow_error::underflow_error(basic_string<char, char_traits<char>, allocator<char> > const&)(GLIBCXX_3.4) [ISOCXX]</code>
<code>underflow_error::underflow_error(basic_string<char, char_traits<char>, allocator<char> > const&)(GLIBCXX_3.4) [ISOCXX]</code>
<code>underflow_error::~~underflow_error()(GLIBCXX_3.4) [ISOCXX]</code>
<code>underflow_error::~~underflow_error()(GLIBCXX_3.4) [ISOCXX]</code>

An LSB conforming implementation shall provide the generic data interfaces for Class `std::underflow_error` specified in Table 16-102, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-102 `libstdcxx` - Class `underflow_error` Data Interfaces

<code>typeinfo</code> for <code>underflow_error</code> (GLIBCXX_3.4) [CXXABI-1.86]
<code>typeinfo</code> name for <code>underflow_error</code> (GLIBCXX_3.4) [CXXABI-1.86]

vtable for underflow_error(GLIBCXX_3.4) [CXXABI-1.86]

16.1.31 Class invalid_argument

16.1.31.1 Class data for invalid_argument

The virtual table for the std::invalid_argument class is described by Table 16-103

Table 16-103 Primary vtable for invalid_argument

Base Offset	0
Virtual Base Offset	0
RTTI	typeinfo for invalid_argument
vfunc[0]:	invalid_argument::~invalid_argument()
vfunc[1]:	invalid_argument::~invalid_argument()
vfunc[2]:	logic_error::what() const

The Run Time Type Information for the std::invalid_argument class is described by Table 16-104

Table 16-104 typeinfo for invalid_argument

Base Vtable	vtable for __cxxabiv1::__si_class_type_info
Name	typeinfo name for invalid_argument

16.1.31.2 Interfaces for Class invalid_argument

An LSB conforming implementation shall provide the generic methods for Class std::invalid_argument specified in Table 16-105, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-105 libstdc++ - Class invalid_argument Function Interfaces

invalid_argument::invalid_argument(basic_string<char, char_traits<char>, allocator<char> > const&)(GLIBCXX_3.4) [ISOCXX]
invalid_argument::invalid_argument(basic_string<char, char_traits<char>, allocator<char> > const&)(GLIBCXX_3.4) [ISOCXX]
invalid_argument::~invalid_argument()(GLIBCXX_3.4) [ISOCXX]
invalid_argument::~invalid_argument()(GLIBCXX_3.4) [ISOCXX]

An LSB conforming implementation shall provide the generic data interfaces for Class std::invalid_argument specified in Table 16-106, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-106 libstdcxx - Class invalid_argument Data Interfaces

typeinfo for invalid_argument(GLIBCXX_3.4) [CXXABI-1.86]
typeinfo name for invalid_argument(GLIBCXX_3.4) [CXXABI-1.86]
vtable for invalid_argument(GLIBCXX_3.4) [CXXABI-1.86]

16.1.32 Class bad_cast

16.1.32.1 Class data for bad_cast

The virtual table for the std::bad_cast class is described by Table 16-107

Table 16-107 Primary vtable for bad_cast

Base Offset	0
Virtual Base Offset	0
RTTI	typeinfo for bad_cast
vfunc[0]:	bad_cast::~~bad_cast()
vfunc[1]:	bad_cast::~~bad_cast()
vfunc[2]:	exception::what() const

The Run Time Type Information for the std::bad_cast class is described by Table 16-108

Table 16-108 typeinfo for bad_cast

Base Vtable	vtable for __cxxabiv1::__si_class_type_info
Name	typeinfo name for bad_cast

16.1.32.2 Interfaces for Class bad_cast

An LSB conforming implementation shall provide the generic methods for Class std::bad_cast specified in Table 16-109, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-109 libstdcxx - Class bad_cast Function Interfaces

bad_cast::~~bad_cast()(GLIBCXX_3.4) [ISOCXX]
bad_cast::~~bad_cast()(GLIBCXX_3.4) [ISOCXX]
bad_cast::~~bad_cast()(GLIBCXX_3.4) [ISOCXX]

An LSB conforming implementation shall provide the generic data interfaces for Class std::bad_cast specified in Table 16-110, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-110 libstdcxx - Class bad_cast Data Interfaces

typeinfo for bad_cast(GLIBCXX_3.4) [CXXABI-1.86]
typeinfo name for bad_cast(GLIBCXX_3.4) [CXXABI-1.86]
vtable for bad_cast(GLIBCXX_3.4) [CXXABI-1.86]

16.1.33 Class bad_alloc

16.1.33.1 Class data for bad_alloc

The virtual table for the std::bad_alloc class is described by Table 16-111

Table 16-111 Primary vtable for bad_alloc

Base Offset	0
Virtual Base Offset	0
RTTI	typeinfo for bad_alloc
vfunc[0]:	bad_alloc::~bad_alloc()
vfunc[1]:	bad_alloc::~bad_alloc()
vfunc[2]:	exception::what() const

The Run Time Type Information for the std::bad_alloc class is described by Table 16-112

Table 16-112 typeinfo for bad_alloc

Base Vtable	vtable for __cxxabiv1::__si_class_type_info
Name	typeinfo name for bad_alloc

16.1.33.2 Interfaces for Class bad_alloc

An LSB conforming implementation shall provide the generic methods for Class std::bad_alloc specified in Table 16-113, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-113 libstdcxx - Class bad_alloc Function Interfaces

bad_alloc::~bad_alloc()(GLIBCXX_3.4) [ISOCXX]
bad_alloc::~bad_alloc()(GLIBCXX_3.4) [ISOCXX]
bad_alloc::~bad_alloc()(GLIBCXX_3.4) [ISOCXX]

An LSB conforming implementation shall provide the generic data interfaces for Class std::bad_alloc specified in Table 16-114, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-114 libstdcxx - Class bad_alloc Data Interfaces

typeid for bad_alloc(GLIBCXX_3.4) [CXXABI-1.86]
typeid name for bad_alloc(GLIBCXX_3.4) [CXXABI-1.86]
vtable for bad_alloc(GLIBCXX_3.4) [CXXABI-1.86]

16.1.34 struct __numeric_limits_base

16.1.34.1 Interfaces for struct __numeric_limits_base

No external methods are defined for libstdcxx - struct __numeric_limits_base in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct __numeric_limits_base specified in Table 16-115, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-115 libstdcxx - struct __numeric_limits_base Data Interfaces

__numeric_limits_base::has_denorm(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::is_bounded(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::is_integer(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::round_style(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::has_infinity(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::max_exponent(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::min_exponent(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::is_specialized(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::max_exponent10(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::min_exponent10(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::tinyness_before(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::radix(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::traps(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::digits(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::digits10(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::is_exact(GLIBCXX_3.4) [ISOCXX]
__numeric_limits_base::is_iec559(GLIBCXX_3.4) [ISOCXX]

<code>__numeric_limits_base::is_modulo(GLIBCXX_3.4)</code> [ISOCXX]
<code>__numeric_limits_base::is_signed(GLIBCXX_3.4)</code> [ISOCXX]

16.1.35 struct `numeric_limits<long double>`

16.1.35.1 Interfaces for struct `numeric_limits<long double>`

No external methods are defined for `libstdcxx` - struct `numeric_limits<long double>` in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct `numeric_limits<long double>` specified in Table 16-116, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-116 `libstdcxx` - struct `numeric_limits<long double>` Data Interfaces

<code>numeric_limits<long double>::has_denorm(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::is_bounded(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::is_integer(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::round_style(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::has_infinity(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::max_exponent(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::min_exponent(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::has_quiet_NaN(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::is_specialized(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::max_exponent10(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::min_exponent10(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::has_denorm_loss(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::tinyness_before(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::has_signaling_NaN(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::radix(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::traps(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::digits(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::digits10(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::is_exact(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::is_iec559(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::is_modulo(GLIBCXX_3.4)</code> [ISOCXX]
<code>numeric_limits<long double>::is_signed(GLIBCXX_3.4)</code> [ISOCXX]

16.1.36 struct numeric_limits<long long>

16.1.36.1 Interfaces for struct numeric_limits<long long>

No external methods are defined for libstdcxx - struct numeric_limits<long long> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<long long> specified in Table 16-117, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-117 libstdcxx - struct numeric_limits<long long> Data Interfaces

numeric_limits<long long>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long long>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.37 struct numeric_limits<unsigned long long>

16.1.37.1 Interfaces for struct numeric_limits<unsigned long long>

No external methods are defined for libstdc++ - struct numeric_limits<unsigned long long> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<unsigned long long> specified in Table 16-118, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-118 libstdc++ - struct numeric_limits<unsigned long long> Data Interfaces

numeric_limits<unsigned long long>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::digits10(GLIBCXX_3.4) [ISOCXX]

numeric_limits<unsigned long long>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long long>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.38 struct numeric_limits<float>

16.1.38.1 Interfaces for struct numeric_limits<float>

No external methods are defined for libstdc++ - struct numeric_limits<float> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<float> specified in Table 16-119, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-119 libstdc++ - struct numeric_limits<float> Data Interfaces

numeric_limits<float>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<float>::traps(GLIBCXX_3.4) [ISOCXX]

numeric_limits<float>::is_signed(GLIBCXX_3.4) [ISOCXX]
--

16.1.39 struct numeric_limits<double>

16.1.39.1 Interfaces for struct numeric_limits<double>

No external methods are defined for libstdc++ - struct numeric_limits<double> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<double> specified in Table 16-120, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-120 libstdc++ - struct numeric_limits<double> Data Interfaces

numeric_limits<double>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<double>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.40 struct numeric_limits<short>

16.1.40.1 Interfaces for struct numeric_limits<short>

No external methods are defined for libstdcxx - struct numeric_limits<short> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<short> specified in Table 16-121, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-121 libstdcxx - struct numeric_limits<short> Data Interfaces

numeric_limits<short>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<short>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.41 struct numeric_limits<unsigned short>

16.1.41.1 Interfaces for struct numeric_limits<unsigned short>

No external methods are defined for libstdc++ - struct numeric_limits<unsigned short> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<unsigned short> specified in Table 16-122, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-122 libstdc++ - struct numeric_limits<unsigned short> Data Interfaces

numeric_limits<unsigned short>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned short>::min_exponent10(GLIBCXX_3.4) [ISOCXX]

numeric_limits<int>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<int>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<int>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<int>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.43 struct numeric_limits<unsigned int>

16.1.43.1 Interfaces for struct numeric_limits<unsigned int>

No external methods are defined for libstdc++ - struct numeric_limits<unsigned int> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<unsigned int> specified in Table 16-124, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-124 libstdc++ - struct numeric_limits<unsigned int> Data Interfaces

numeric_limits<unsigned int>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned int>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.44 struct numeric_limits<long>

16.1.44.1 Interfaces for struct numeric_limits<long>

No external methods are defined for libstdcxx - struct numeric_limits<long> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<long> specified in Table 16-125, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-125 libstdcxx - struct numeric_limits<long> Data Interfaces

numeric_limits<long>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<long>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.45 struct numeric_limits<unsigned long>

16.1.45.1 Interfaces for struct numeric_limits<unsigned long>

No external methods are defined for libstdc++ - struct numeric_limits<unsigned long> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<unsigned long> specified in Table 16-126, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-126 libstdc++ - struct numeric_limits<unsigned long> Data Interfaces

numeric_limits<unsigned long>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned long>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.46 struct numeric_limits<wchar_t>

16.1.46.1 Interfaces for struct numeric_limits<wchar_t>

No external methods are defined for libstdc++ - struct numeric_limits<wchar_t> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<wchar_t> specified in Table 16-127, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-127 libstdc++ - struct numeric_limits<wchar_t> Data Interfaces

numeric_limits<wchar_t>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<wchar_t>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.47 struct numeric_limits<unsigned char>

16.1.47.1 Interfaces for struct numeric_limits<unsigned char>

No external methods are defined for libstdc++ - struct numeric_limits<unsigned char> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<unsigned char> specified in Table 16-128, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-128 libstdc++ - struct numeric_limits<unsigned char> Data Interfaces

numeric_limits<unsigned char>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<unsigned char>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.48 struct numeric_limits<signed char>

16.1.48.1 Interfaces for struct numeric_limits<signed char>

No external methods are defined for libstdcxx - struct numeric_limits<signed char> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<signed char> specified in Table 16-129, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-129 libstdcxx - struct numeric_limits<signed char> Data Interfaces

numeric_limits<signed char>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<signed char>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.49 struct numeric_limits<char>

16.1.49.1 Interfaces for struct numeric_limits<char>

No external methods are defined for libstdcxx - struct numeric_limits<char> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<char> specified in Table 16-130, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-130 libstdcxx - struct numeric_limits<char> Data Interfaces

numeric_limits<char>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<char>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.50 struct numeric_limits<bool>

16.1.50.1 Interfaces for struct numeric_limits<bool>

No external methods are defined for libstdcxx - struct numeric_limits<bool> in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for struct numeric_limits<bool> specified in Table 16-131, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-131 libstdcxx - struct numeric_limits<bool> Data Interfaces

numeric_limits<bool>::has_denorm(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::is_bounded(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::is_integer(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::round_style(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::has_infinity(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::max_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::min_exponent(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::has_quiet_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::is_specialized(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::max_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::min_exponent10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::has_denorm_loss(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::tinyness_before(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::has_signaling_NaN(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::radix(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::traps(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::digits(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::digits10(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::is_exact(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::is_iec559(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::is_modulo(GLIBCXX_3.4) [ISOCXX]
numeric_limits<bool>::is_signed(GLIBCXX_3.4) [ISOCXX]

16.1.51 Class `ctype_base`

16.1.51.1 Class data for `ctype_base`

The Run Time Type Information for the `std::ctype_base` class is described by Table 16-132

Table 16-132 `typeinfo` for `ctype_base`

Base Vtable	vtable for <code>__cxxabiv1::__class_type_info</code>
Name	<code>typeinfo</code> name for <code>ctype_base</code>

16.1.51.2 Interfaces for Class `ctype_base`

No external methods are defined for `libstdcxx` - Class `std::ctype_base` in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for Class `std::ctype_base` specified in Table 16-133, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-133 `libstdcxx` - Class `ctype_base` Data Interfaces

<code>ctype_base::alnum(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::alpha(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::cntrl(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::digit(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::graph(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::lower(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::print(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::punct(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::space(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::upper(GLIBCXX_3.4)</code> [ISOCXX]
<code>ctype_base::xdigit(GLIBCXX_3.4)</code> [ISOCXX]
<code>typeinfo</code> for <code>ctype_base</code> (GLIBCXX_3.4) [CXXABI-1.86]
<code>typeinfo</code> name for <code>ctype_base</code> (GLIBCXX_3.4) [CXXABI-1.86]

16.1.52 Class `__ctype_abstract_base<char>`

16.1.52.1 Class data for `__ctype_abstract_base<char>`

The virtual table for the `std::__ctype_abstract_base<char>` class is described by Table 16-134

Table 16-134 Primary vtable for `__ctype_abstract_base<char>`

Base Offset	0
Virtual Base Offset	0
RTTI	typeinfo for <code>__ctype_abstract_base<char></code>
<code>vfunc[0]:</code>	NULL or <code>__ctype_abstract_base<char>::~__ctype_abstract_base()</code>
<code>vfunc[1]:</code>	NULL or <code>__ctype_abstract_base<char>::~__ctype_abstract_base()</code>
<code>vfunc[2]:</code>	<code>__cxa_pure_virtual</code>
<code>vfunc[3]:</code>	<code>__cxa_pure_virtual</code>

16.1.53.2 Interfaces for Class

`__ctype_abstract_base<wchar_t>`

No external methods are defined for `libstdcxx` - Class `std::__ctype_abstract_base<wchar_t>` in this part of the specification. See also the relevant architecture specific part of this specification.

An LSB conforming implementation shall provide the generic data interfaces for Class `std::__ctype_abstract_base<wchar_t>` specified in Table 16-137, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-137 libstdcxx - Class `__ctype_abstract_base<wchar_t>` Data Interfaces

typeinfo for <code>__ctype_abstract_base<wchar_t></code> (GLIBCXX_3.4) [CXXABI-1.86]

--

16.1.150 Class char_traits<wchar_t>**16.1.150.1 Interfaces for Class char_traits<wchar_t>**

An LSB conforming implementation shall provide the generic methods for Class `std::char_traits<wchar_t>` specified in Table 16-441, with the full mandatory functionality as described in the referenced underlying specification.

Table 16-441 libstdcxx - Class char_traits<wchar_t> Function Interfaces

<code>char_traits<wchar_t>::eq(wchar_t const&, wchar_t const&)(GLIBCXX_3.4.5) [ISOCXX]</code>

16.2 Interface Definitions for libstdcxx

The interfaces defined on the following pages are included in libstdcxx and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 16.1 shall behave as described in the referenced base document.

VI Commands and Utilities

17 Commands and Utilities

17.1 Commands and Utilities

An LSB conforming implementation shall provide the commands and utilities as described in Table 17-1, with at least the behavior described as mandatory in the referenced underlying specification, with the following exceptions:

1. If any operand (except one which follows --) starts with a hyphen, the behavior is unspecified.

Rationale (Informative): Applications should place options before operands, or use --, as needed. This text is needed because, by default, GNU option parsing differs from POSIX, unless the environment variable POSIXLY_CORRECT is set. For example, `ls . -a` in GNU `ls` means to list the current directory, showing all files (that is, "." is an operand and `-a` is an option). In POSIX, "." and `-a` are both operands, and the command means to list the current directory, and also the file named `-a`. Suggesting that applications rely on the setting of the `POSIXLY_CORRECT` environment variable, or try to set it, seems worse than just asking the applications to invoke commands in ways which work with either the POSIX or GNU behaviors.

Referenced Specification(s)

[1]. POSIX 1003.1-2008 (ISO/IEC 9945-2009)

[2]. This Specification

[3]. Libncursesw API

An LSB conforming implementation shall provide the shell built in utilities as described in Table 17-2, with at least the behavior described as mandatory in the referenced underlying specification, with the following exceptions:

1. The built in commands and utilities shall be provided by the **sh** utility itself, and need not be implemented in a manner so that they can be accessed via the **exec** family of functions as defined in POSIX 1003.1-2008 (ISO/IEC 9945-2009) and should not be invoked directly by those standard utilities that execute other utilities (**env**, **find**, **nice**, **nohup**, **time**, **xargs**).

Rationale (Informative): Since the built in utilities must affect the environment of the calling process, they have no effect when executed as a file.

Table 17-2 Built In Utilities

alias [1]	command [1]	getopts [1]	read [1]	umask [1]
bg [1]	fc [1]	hash [1]	type [1]	unalias [1]
cd [1]	fg [1]	jobs [1]	ulimit [1]	wait [1]

Referenced Specification(s)

[1]. POSIX 1003.1-2008 (ISO/IEC 9945-2009)

17.2 Command Behavior

This section contains descriptions for commands and utilities whose specified behavior in the LSB contradicts or extends the standards referenced. It also

contains commands and utilities only required by the LSB and not specified by other standards.

ar

Name

ar — create and maintain library archives (DEPRECATED)

Description

ar is deprecated from the LSB and is expected to disappear from a future version of the LSB.

Rationale: The LSB generally does not include software development utilities nor does it specify .o and .a file formats.

ar is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009) but with differences as listed below.

Differences

-T

-C

need not be accepted.

-l

has unspecified behavior.

-q

has unspecified behavior; using -r is suggested.

at**Name**

`at` — examine or delete jobs for later execution

Description

`at` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009) but with differences as listed below.

Differences**Options**

`-d`

is functionally equivalent to the `-r` option specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

`-r`

need not be supported, but the `'-d'` option is equivalent.

`-t time`

need not be supported.

Optional Control Files

The implementation shall support the XSI optional behavior for access control; however the files `at.allow` and `at.deny` may reside in `/etc` rather than `/usr/lib/cron`.

awk**Name**

`awk` — pattern scanning and processing language

Description

`awk` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009) but with differences as listed below.

Differences

Certain aspects of internationalized regular expressions are optional; see Regular Expressions.

batch**Name**

batch — schedule commands to be executed in a batch queue

Description

The specification for **batch** is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Optional Control Files

The implementation shall support the XSI optional behavior for access control; however the files `at.allow` and `at.deny` may reside in `/etc` rather than `/usr/lib/cron`.

bc**Name**

bc — an arbitrary precision calculator language

Description

bc is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009) but with extensions as listed below.

Extensions

The **bc** language may be extended in an implementation defined manner. If an implementation supports extensions, it shall also support the additional options:

`-s|--standard`

processes exactly the POSIX **bc** language.

`-w|--warn`

gives warnings for extensions to POSIX **bc**.

chfn**Name**

chfn — change user name and information

Synopsis

chfn `[-f full_name] [-h home_phone] [user]`

Description

chfn shall update the user database. An unprivileged user may only change the fields for their own account, a user with appropriate privileges may change the fields for any account.

The fields *full_name* and *home_phone* may contain any character except:

any control character
 comma
 colon
 equal sign

If none of the options are selected, **chfn** operates in an interactive fashion. The prompts and expected input in interactive mode are unspecified and should not be relied upon.

As it is possible for the system to be configured to restrict which fields a non-privileged user is permitted to change, applications should be written to gracefully handle these situations.

Standard Options

-f full_name

sets the user's full name.

-h home_phone

sets the user's home phone number.

Future Directions

The following two options are expected to be added in a future version of the LSB:

-o office

sets the user's office room number.

-p office_phone

sets the user's office phone number.

Note that some implementations contain a "-o other" option which specifies an additional field called "other". Traditionally, this field is not subject to the constraints about legitimate characters in fields. Also, one traditionally shall have appropriate privileges to change the other field. At this point there is no consensus about whether it is desirable to specify the other field; applications may wish to avoid using it.

The "-w work_phone" field found in some implementations should be replaced by the "-p office_phone" field. The "-r room_number" field found in some implementations is the equivalent of the "-o office" option mentioned above; which one of these two options to specify will depend on implementation experience and the decision regarding the other field.

chsh

Name

`chsh` — change login shell

Synopsis

```
chsh [-s login_shell] [user]
```

Description

chsh changes the user login shell. This determines the name of the user's initial login command. An unprivileged user may only change the login shell for their own account, a user with appropriate privilege may change the login shell for any account specified by *user*.

Unless the user has appropriate privilege, the initial login command name shall be one of those listed in `/etc/shells`. The *login_shell* shall be the absolute path (i.e. it must start with '/') to an executable file. Accounts which are restricted (in an implementation-defined manner) may not change their login shell.

If the `-s` option is not selected, **chsh** operates in an interactive mode. The prompts and expected input in this mode are unspecified.

Standard Options

```
-s login_shell
```

sets the login shell.

col

Name

`col` — filter reverse line feeds from input

Description

col is as specified in SUSv2 but with differences as listed below.

Differences

The `-p` option has unspecified behavior.

Note: Although **col** is shown as legacy in SUSv2, it is not (yet) deprecated in the LSB.

cpio**Name**

`cpio` — copy file archives in and out

Description

`cpio` is as specified in SUSv2, but with differences as listed below.

Differences

Some elements of the Pattern Matching Notation are optional; see Pattern Matching Notation.

crontab**Name**

`crontab` — maintain crontab files for individual users

Synopsis

```
crontab [-u user] file crontab [-u user] {-l | -r | -e}
```

Description

`crontab` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Optional Control Files

The implementation shall support the XSI optional behavior for access control; however the files `cron.allow` and `cron.deny` may reside in `/etc` rather than `/usr/lib/cron`.

df

Name

df — report file system disk space usage

Description

The **df** command shall behave as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

Options

If the *-k* option is not specified, disk space is shown in unspecified units. If the *-P* option is specified, the size of the unit shall be printed on the header line in the format "*%4s-blocks*". Applications should specify *-k*.

The XSI option *-t* has unspecified behavior. Applications should not specify *-t*.

Rationale: The most common implementation of **df** uses the *-t* option for a different purpose (restricting output to a particular file system type), and use of *-t* is therefore non-portable.

Operand May Identify Special File

If an argument is the absolute file name of a special file containing a mounted file system, **df** shall show the space available on that file system rather than on the file system containing the special file (which is typically the root file system).

Note: In POSIX 1003.1-2008 (ISO/IEC 9945-2009) the XSI optional behavior permits an operand to name a special file, but appears to require the operation be performed on the file system containing the special file. A defect report has been submitted for this case.

dmesg

Name

`dmesg` — print or control the system message buffer

Synopsis

`dmesg` [`-c` | `-n level` | `-s bufsize`]

Description

`dmesg` examines or controls the system message buffer. Only a user with appropriate privileges may modify the system message buffer parameters or contents.

Standard Options

`-c`

If the user has appropriate privilege, clears the system message buffer contents after printing.

`-n level`

If the user has appropriate privilege, sets the level at which logging of messages is done to the console.

`-s bufsize`

uses a buffer of *bufsize* to query the system message buffer. This is 16392 by default.

du

Name

`du` — estimate file space usage

Description

`du` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

If the `-k` option is not specified, disk space is shown in unspecified units. Applications should specify `-k`.

echo

Name

echo — write arguments to standard output

Synopsis

echo [string...]

Description

The **echo** command is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with the following differences.

Implementations may support implementation-defined options to **echo**. The behavior of **echo** if any arguments contain backslashes is also implementation defined.

Application Usage

Conforming applications should not run **echo** with a first argument starting with a hyphen, or with any arguments containing backslashes; they should use **printf** in those cases.

Note: The behavior specified here is similar to that specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009) without the XSI option. However, the LSB strongly recommends conforming applications not use any options (even if the implementation provides them) while POSIX 1003.1-2008 (ISO/IEC 9945-2009) specifies behavior if the first operand is the string *-n*.

egrep

Name

egrep — search a file with an Extended Regular Expression pattern

Description

egrep is equivalent to **grep -E**. For further details, see the specification for **grep**.

fgrep

Name

fgrep — search a file with a fixed pattern

Description

fgrep is equivalent to **grep -F**. For further details, see the specification for **grep**.

file**Name**

`file` — determine file type

Description

file is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

The `-M`, `-h`, `-d`, and `-i` options need not be supported.

fuser**Name**

`fuser` — identify processes using files or sockets

Description

fuser is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

The **fuser** command is a system administration utility, see Path For System Administration Utilities.

Option Differences

`-c`

has unspecified behavior.

`-f`

has unspecified behavior.

gettext

Name

`gettext` — retrieve text string from message catalog

Synopsis

gettext [options] [textdomain] msgid **gettext** -s [options] msgid...

Description

The **gettext** utility retrieves a translated text string corresponding to string *msgid* from a message object generated with **msgfmt** utility.

The message object name is derived from the optional argument *textdomain* if present, otherwise from the `TEXTDOMAIN` environment variable. If no domain is specified, or if a corresponding string cannot be found, **gettext** prints *msgid*.

Ordinarily **gettext** looks for its message object in *dirname/lang/LC_MESSAGES* where *dirname* is the implementation-defined default directory and *lang* is the locale name. If present, the `TEXTDOMAINDIR` environment variable replaces the *dirname*.

This utility interprets C escape sequences such as `\t` for tab. Use `\\` to print a backslash. To produce a message on a line of its own, either put a `\n` at the end of *msgid*, or use this command in conjunction with the **printf** utility.

When used with the `-s` option the **gettext** utility behaves like the **echo** utility, except that the message corresponding to *msgid* in the selected catalog provides the arguments.

Options

`-d domainname`
`--domain=domainname`

PARAMETER translated messages from domainname.

`-e`

Enable expansion of some escape sequences.

`-n`

Suppress trailing newline.

Operands

The following operands are supported:

textdomain

A domain name used to retrieve the messages.

msgid

A key to retrieve the localized message.

Environment Variables

`LANGUAGE`

Specifies one or more locale names.

LANG

Specifies locale name.

LC_MESSAGES

Specifies messaging locale, and if present overrides LANG for messages.

TEXTDOMAIN

Specifies the text domain name, which is identical to the message object filename without .mo suffix.

TEXTDOMAINDIR

Specifies the pathname to the message catalog, and if present replaces the implementation-defined default directory.

Exit Status

The following exit values are returned:

0

Successful completion.

>0

An error occurred.

grep

Name

grep — print lines matching a pattern

Description

grep is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

LSB Differences

Certain aspects of regular expression matching are optional; see Regular Expressions.

groupadd

Name

groupadd — create a new group

Synopsis

groupadd [-g *gid* [-o]] *group*

Description

If the caller has appropriate privilege, the **groupadd** command shall create a new group named *group*. The group name shall be unique in the group database. If no *gid* is specified, **groupadd** shall create the new group with a unique group ID. If the group named *group* already exists, or if a group with *gid* ID exists and *-o* option is not set, **groupadd** shall issue a diagnostic message and exit with a non-zero exit status.

The **groupadd** command is a system administration utility, see Path For System Administration Utilities.

Options

-g gid [-o]

The new group shall have group ID *gid*. If the *-o* option is not used, no other group shall have this group ID. The value of *gid* shall be non-negative.

groupdel

Name

groupdel — delete a group

Synopsis

groupdel *group*

Description

If the caller has sufficient privilege, the **groupdel** command shall modify the system group database, deleting the group named *group*. If the group named *group* does not exist or is a primary group for existing user, **groupdel** shall issue a diagnostic message and exit with a non-zero exit status.

The **groupdel** command is a system administration utility, see Path For System Administration Utilities.

groupmod

Name

groupmod — modify a group

Synopsis

```
groupmod [-g gid [-o]] [-n group_name] group
```

Description

If the caller has appropriate privilege, the **groupmod** command shall modify the entry in the system group database corresponding to a group named *group*.

The **groupmod** command is a system administration utility, see Path For System Administration Utilities.

Options

```
-g gid [-o]
```

Modify the group's group ID, setting it to *gid*. If the *-o* option is not used, no other group shall have this group ID. The value of *gid* shall be non-negative.

Note: Only the group ID in the database is altered; any files with group ownership set to the original group ID are unchanged by this modification.

```
-n group_name
```

changes the name of the group from *group* to *group_name*.

groups

Name

groups — display a group

Synopsis

```
groups [user]
```

Description

The **groups** command shall behave as **id -Gn [*user*]**, as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). The optional *user* parameter will display the groups for the named user.

gunzip

Name

`gunzip` — uncompress files

Description

gunzip is equivalent to **gzip -d**. See the specification for **gzip** for further details.

Filesystem Hierarchy Standard requires that if **gunzip** exists, it must be a symbolic or hard link to `/bin/gzip`. This specification additionally allows **gunzip** to be a wrapper script which calls **gzip -d**.

gzip

Name

gzip — compress or expand files

Synopsis

```
gzip [-cdfhlLnNrtvV19] [-S suffix] [name...]
```

Description

The **gzip** command shall attempt to reduce the size of the named files. Whenever possible, each file is replaced by one with the extension `.gz`, while keeping the same ownership, modes, access and modification times. If no files are specified, or if a file name is `-`, the standard input is compressed to the standard output. **gzip** shall only attempt to compress regular files. In particular, it will ignore symbolic links.

When compressing, **gzip** uses the deflate algorithm specified in RFC 1951: DEFLATE Compressed Data Format Specification and stores the result in a file using the gzip file format specified in RFC 1952: GZIP File Format Specification.

Options

`-c, --stdout, --to-stdout`

writes output on standard output, leaving the original files unchanged. If there are several input files, the output consists of a sequence of independently compressed members. To obtain better compression, concatenate all input files before compressing them.

`-d, --decompress, --uncompress`

the name operands are compressed files, and **gzip** shall decompress them.

`-f, --force`

forces compression or decompression even if the file has multiple links or the corresponding file already exists, or if the compressed data is read from or written to a terminal. If the input data is not in a format recognized by **gzip**, and if the option `--stdout` is also given, copy the input data without change to the standard output: let **gzip** behave as **cat**. If `-f` is not given, and when not running in the background, **gzip** prompts to verify whether an existing file should be overwritten.

`-l, --list`

lists the compressed size, uncompressed size, ratio and uncompressed name for each compressed file. For files that are not in **gzip** format, the uncompressed size shall be given as `-1`. If the `--verbose` or `-v` option is also specified, the crc and timestamp for the uncompressed file shall also be displayed.

For decompression, **gzip** shall support at least the following compression methods:

- deflate (RFC 1951: DEFLATE Compressed Data Format Specification)

- compress (POSIX 1003.1-2008 (ISO/IEC 9945-2009))

The crc shall be given as `ffffffff` for a file not in **gzip** format.

If the `--name` or `-N` option is also specified, the uncompressed name, date and time are those stored within the compressed file, if present.

If the `--quiet` or `-q` option is also specified, the title and totals lines are not displayed.

`-L, --license`

displays the **gzip** license and quit.

`-n, --no-name`

does not save the original file name and time stamp by default when compressing. (The original name is always saved if the name had to be truncated.) When decompressing, do not restore the original file name if present (remove only the **gzip** suffix from the compressed file name) and do not restore the original time stamp if present (copy it from the compressed file). This option is the default when decompressing.

`-N, --name`

always saves the original file name and time stamp when compressing; this is the default. When decompressing, restore the original file name and time stamp if present. This option is useful on systems which have a limit on file name length or when the time stamp has been lost after a file transfer.

`-q, --quiet`

suppresses all warnings.

`-r, --recursive`

travels the directory structure recursively. If any of the file names specified on the command line are directories, **gzip** will descend into the directory and compress all the files it finds there (or decompress them in the case of **gunzip**).

`-S .suf, --suffix .suf`

uses suffix `.suf` instead of `.gz`.

`-t, --test`

checks the compressed file integrity.

`-v, --verbose`

displays the name and percentage reduction for each file compressed or decompressed.

`-#, --fast, --best`

regulates the speed of compression using the specified digit #, where *-1* or *-fast* indicates the fastest compression method (less compression) and *-9* or *--best* indicates the slowest compression method (best compression). The default compression level is *-6* (that is, biased towards high compression at expense of speed).

LSB Deprecated Options

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

-V, --version

displays the version number and compilation options, then quits.

hostname

Name

hostname — show or set the system's host name

Synopsis

hostname [*name*]

Description

hostname is used to either display or, with appropriate privileges, set the current host name of the system. The host name is used by many applications to identify the machine.

When called without any arguments, the program displays the name of the system as returned by the `gethostname()` function.

When called with a *name* argument, and the user has appropriate privilege, the command sets the host name.

Note: It is not specified if the hostname displayed will be a fully qualified domain name. Applications requiring a particular format of hostname should check the output and take appropriate action.

install

Name

`install` — copy files and set attributes

Synopsis

```
install [option...] SOURCE DEST install [option...] SOURCE... DEST install
[-d | --directory] [option...] DIRECTORY...
```

Description

In the first two formats, copy *SOURCE* to *DEST* or multiple *SOURCE(s)* to the existing *DEST* directory, optionally setting permission modes and file ownership. In the third format, each *DIRECTORY* and any missing parent directories shall be created.

Standard Options

`--backup[=METHOD]`

makes a backup of each existing destination file. *METHOD* may be one of the following:

none or *off*

never make backups.

numbered or *t*

make numbered backups. A numbered backup has the form "*%s.~%d~*", *target_name*, *version_number*. Each backup shall increment the version number by 1.

existing or *nil*

behave as numbered if numbered backups exist, or simple otherwise.

simple or *never*

append a suffix to the name. The default suffix is '~', but can be overridden by setting `SIMPLE_BACKUP_SUFFIX` in the environment, or via the `-S` or `--suffix` option.

If no *METHOD* is specified, the environment variable `VERSION_CONTROL` shall be examined for one of the above. Unambiguous abbreviations of *METHOD* shall be accepted. If no *METHOD* is specified, or if *METHOD* is empty, the backup method shall default to *existing*.

If *METHOD* is invalid or ambiguous, **install** shall fail and issue a diagnostic message.

`-b`

is equivalent to `--backup=existing`.

`-d, --directory`

treats all arguments as directory names; creates all components of the specified directories.

-D

creates all leading components of DEST except the last, then copies SOURCE to DEST; useful in the 1st format.

-g GROUP, --group=GROUP

if the user has appropriate privilege, sets group ownership, instead of process' current group. *GROUP* is either a name in the user group database, or a positive integer, which shall be used as a group-id.

-m MODE, --mode=MODE

sets permission mode (specified as in **chmod**), instead of the default `rwxr-xr-x`.

-o OWNER, --owner=OWNER

if the user has appropriate privilege, sets ownership. *OWNER* is either a name in the user login database, or a positive integer, which shall be used as a user-id.

-p, --preserve-timestamps

copies the access and modification times of *SOURCE* files to corresponding destination files.

-s, --strip

strips symbol tables, only for 1st and 2nd formats.

-S SUFFIX, --suffix=SUFFIX

equivalent to `--backup=existing`, except if a simple suffix is required, use *SUFFIX*.

--verbose

prints the name of each directory as it is created.

-v, --verbose

print the name of each file before copying it to `stdout`.

install_initd

Name

`install_initd` — activate an init script

Synopsis

```
/usr/lib/lsb/install_initd initd_file
```

Description

install_initd shall activate a system initialization file that has been copied to an implementation defined location such that this file shall be run at the appropriate point during system initialization. The **install_initd** command is typically called in the postinstall script of a package, after the script has been copied to `/etc/init.d`. See also Installation and Removal of Init Scripts.

ipcrm

Name

`ipcrm` — remove IPC Resources

Synopsis

```
ipcrm [-q msgid | -Q msgkey | -s semid | -S semkey | -m shmid | -M  
shmkey]...ipcrm [shm | msg | msg] id...
```

Description

If any of the `-q`, `-Q`, `-s`, `-S`, `-m`, or `-M` arguments are given, the **ipcrm** shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

Otherwise, **ipcrm** shall remove the resource of the specified type identified by *id*.

Future Directions

A future revision of this specification may deprecate the second synopsis form.

Rationale: In its first Linux implementation, **ipcrm** used the second syntax shown in the SYNOPSIS. Functionality present in other implementations of **ipcrm** has since been added, namely the ability to delete resources by key (not just identifier), and to respect the same command line syntax. The previous syntax is still supported for backwards compatibility only.

ipcs

Name

`ipcs` — provide information on ipc facilities

Synopsis

`ipcs` [-smq] [-tcp]

Description

`ipcs` provides information on the ipc facilities for which the calling process has read access.

Note: Although this command has many similarities with the optional `ipcs` utility described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), it has substantial differences and is therefore described separately. The options specified here have similar meaning to those in POSIX 1003.1-2008 (ISO/IEC 9945-2009); other options specified there have unspecified behavior on an LSB conforming implementation. See Application Usage below. The output format is not specified.

Resource display options

-m
shared memory segments.

-q
message queues.

-s
semaphore arrays.

Output format options

-t
time.

-p
pid.

-c
creator.

Application Usage

In some implementations of `ipcs` the `-a` option will print all information available. In other implementations the `-a` option will print all resource types. Therefore, applications shall not use the `-a` option.

Some implementations of **ipcs** provide more output formats than are specified here. These options are not consistent between differing implementations of **ipcs**. Therefore, only the `-t`, `-c` and `-p` option formatting flags may be used. At least one of the `-t`, `-c` and `-p` options and at least one of `-m`, `-q` and `-s` options shall be specified. If no options are specified, the output is unspecified.

killall

Name

killall — kill processes by name

Synopsis

```
killall [-egiqvw] [-signal] name... killall -l killall -v
```

Description

killall sends a signal to all processes running any of the specified commands. If no signal name is specified, `SIGTERM` is sent.

Signals can be specified either by name (e.g. `-HUP`) or by number (e.g. `-1`). Signal 0 (check if a process exists) can only be specified by number.

If the command name contains a slash (/), processes executing that particular file will be selected for killing, independent of their name.

killall returns a non-zero return code if no process has been killed for any of the listed commands. If at least one process has been killed for each command, **killall** returns zero.

A **killall** process never kills itself (but may kill other **killall** processes).

Standard Options

-e

requires an exact match for very long names. If a command name is longer than 15 characters, the full name may be unavailable (i.e. it is swapped out). In this case, **killall** will kill everything that matches within the first 15 characters. With **-e**, such entries are skipped. **killall** prints a message for each skipped entry if **-v** is specified in addition to **-e**.

-g

kills the process group to which the process belongs. The kill signal is only sent once per group, even if multiple processes belonging to the same process group were found.

-i

asks interactively for confirmation before killing.

-l

lists all known signal names.

-q

does not complain if no processes were killed.

-v

reports if the signal was successfully sent.

LSB Deprecated Options

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

-V

displays version information.

lpr

Name

lpr — off line print

Synopsis

```
lpr [-l] [-p] [-Pprinter] [-h] [-s] [-#copies] [-J name] [-T title]
[name .....
```

Description

lpr uses a spooling daemon to print the named files when facilities become available. If no names appear, the standard input is assumed.

Standard Options

-l

identifies binary data that is not to be filtered but sent as raw input to printer.

-p

formats with "pr" before sending to printer.

-Pprinter

sends output to the printer named printer instead of the default printer.

-h

suppresses header page.

-s

uses symbolic links.

-#copies

specifies copies as the number of copies to print.

-J name

specifies name as the job name for the header page.

-T title

specifies title as the title used for "pr".

ls

Name

ls — list directory contents

Description

ls shall behave as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with extensions listed below.

Extensions

-l

If the file is a character special or block special file, the size of the file shall be replaced with two unsigned numbers in the format "%u, %u", representing the major and minor device numbers associated with the special file.

Note: The LSB does not specify the meaning of the major and minor devices numbers.

-P

in addition to POSIX 1003.1-2008 (ISO/IEC 9945-2009) XSI optional behavior of printing a slash for a directory, **ls -P** may display other characters for other file types.

lsb_release

Name

`lsb_release` — print distribution specific information

Synopsis

`lsb_release` [option...]

Description

The **lsb_release** command prints certain LSB (Linux Standard Base) and Distribution information.

If no options are given, the `-v` option is the default.

Options

`-v, --version`

displays the LSB version the distribution is compliant with. The version is expressed as a colon separated list of versioned LSB module identifiers. An LSB module identifier is a dash-separated tuple consisting of module name and version or module name, version and architecture name, in that order. The version output is presented as a single line of text beginning with `LSB Version:` followed by a tab character, then the list of LSB module identifiers. This format is intended to be easily parsable by programs which need to consume the data. Excepting `core`, which must always be present, the list of module identifiers may change over time depending on installations and removals of system software.

Example: `LSB Version: core-5.0-amd64:core-5.0-noarch:desktop-5.0-amd64:desktop-5.0-noarch:languages-5.0:imaging-5.0`

Note: An implementation may support multiple releases of the same module. To claim compliance, the implementation shall list all relevant module identifiers. Version specific library interfaces, if any, will be selected by the program interpreter, which may change from release to release. Version specific commands and utilities, if any, will be described in the relevant specification.

For reporting or querying compliance with this release of the specification, use the module names found in the *Package Dependencies* section of the *Package Format and Installation* chapter for that module specification.

`-i, --id`

displays a string identifying the distribution provider. The id output is a single line of text beginning with `Distributor ID:` followed by a tab character, then the id string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: `Distributor ID: Frobnizz`

`-d, --description`

displays text describing the distribution. The description output is a single line of text beginning with `Description:` followed by a tab character, then the description string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: `Description: Frobnizz release 9 (Gilpher)`

`-r, --release`

displays the release number of distribution. The release output is a single line of text beginning with `Release:` followed by a tab character, then the release string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: `Release: 9`

`-c, --codename`

displays a codename which corresponds to the distribution release. The codename output is a single line of text beginning with `Codename:` followed by a tab character, then the codename string. This specification assigns no meaning to the value of the string, the contents are at the discretion of the distribution provider.

Example: `Codename: Gilpher`

`-a, --all`

displays all of the above information.

`-s, --short`

displays all of the above information in a short output format.

`-h, --help`

displays a human-readable help message.

m4

Name

m4 — macro processor

Description

m4 is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with extensions as listed below.

Extensions

`-P`

forces all builtins to be prefixed with `m4_`. For example, `define` becomes `m4_define`.

`-I directory`

Add *directory* to the end of the search path for includes.

md5sum

Name

`md5sum` — generate or check MD5 message digests

Synopsis

md5sum [-c [file] | file]

Description

For each file, write to standard output a line containing the MD5 message digest of that file, followed by one or more blank characters, followed by the name of the file. The MD5 message digest shall be calculated according to RFC 1321: The MD5 Message-Digest Algorithm and output as 32 hexadecimal digits.

If no file names are specified as operands, read from standard input and use "-" as the file name in the output.

Options

-c [file]

checks the MD5 message digest of all files named in *file* against the message digest listed in the same file. The actual format of *file* is the same as the output of **md5sum**. That is, each line in the file describes a file. If *file* is not specified, read message digests from `stdin`.

Exit Status

md5sum shall exit with status 0 if the sum was generated successfully, or, in check mode, if the check matched. Otherwise, **md5sum** shall exit with a non-zero status.

mknod

Name

mknod — make special files

Synopsis

```
mknod [-m mode | --mode=mode] name type [major minor] mknod [--version]
```

Description

The **mknod** command shall create a special file named *name* of the given *type*.

The *type* shall be one of the following:

b

creates a block (buffered) special file with the specified *major* and *minor* device numbers.

c, u

creates a character (unbuffered) special file with the specified *major* and *minor* device numbers.

p

creates a FIFO.

Options

-m *mode*, **--mode**=*mode*

create the special file with file access permissions set as described in *mode*. The permissions may be any absolute value (i.e. one not containing '+' or '-') acceptable to the **chmod** command.

--version

output version information and exit.

Note: This option may be deprecated in a future release of this specification.

If *type* is **p**, *major* and *minor* shall not be specified. Otherwise, these parameters are mandatory.

Future Directions

This command may be deprecated in a future version of this specification. The *major* and *minor* operands are insufficiently portable to be specified usefully here. Only a FIFO can be portably created by this command, and the **mkfifo** command is a simpler interface for that purpose.

mktemp

Name

`mktemp` — make temporary file name (unique)

Synopsis

mktemp [-q] [-u] *template*

Description

The **mktemp** command takes the given file name *template* and overwrites a portion of it to create a file name. This file name shall be unique and suitable for use by the application.

The *template* should have at least six trailing 'x' characters. These characters are replaced with characters from the portable filename character set in order to generate a unique name.

If **mktemp** can successfully generate a unique file name, and the *-u* option is not present, the file shall be created with read and write permission only for the current user. The **mktemp** command shall write the filename generated to the standard output.

Options

-q

fail silently if an error occurs. Diagnostic messages to `stderr` are suppressed, but the command shall still exit with a non-zero exit status if an error occurs.

-u

operates in 'unsafe' mode. A unique name is generated, but the temporary file shall be unlinked before **mktemp** exits. Use of this option is not encouraged.

more**Name**

more — display files on a page-by-page basis

Description

more is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

The **more** command need not respect the `LINES` and `COLUMNS` environment variables.

The following additional options may be supported:

`-num`

specifies an integer which is the screen size (in lines).

`+num`

starts at line number *num*.

`+/pattern`

Start at the first line matching the pattern, equivalent to executing the search forward (/) command with the given pattern immediately after opening each file.

The following options from POSIX 1003.1-2008 (ISO/IEC 9945-2009) may behave differently:

`-e`

has unspecified behavior.

`-i`

has unspecified behavior.

`-n`

has unspecified behavior.

`-p`

Either clear the whole screen before displaying any text (instead of the usual scrolling behavior), or provide the behavior specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009). In the latter case, the syntax is "`-p command`".

`-t`

has unspecified behavior.

The **more** command need not support the following interactive commands:

g
 G
 u
 control u
 control f
 newline
 j
 k
 r
 R
 m
 ' (return to mark)
 /!
 ?
 N
 :e
 :t
 control g
 ZZ

Rationale

The *+num* and *+string* options are deprecated in SUSv2, and have been removed in POSIX 1003.1-2008 (ISO/IEC 9945-2009); however this specification continues to specify them because the publicly available `util-linux` package does not support the replacement (`-p command`). The *+command* option as found in SUSv2 is more general than is specified here, but the `util-linux` package appears to only support the more specific *+num* and *+string* forms.

mount

Name

`mount` — mount a file system

Synopsis

```
mount [-hV]mount [-a] [-fFnrsvw] [-t vfstype]mount [-fnrsvw] [-o options
[,...]] [device | dir]mount [-fnrsvw] [-t vfstype] [-o options] device dir
```

Description

As described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), all files in the system are organized in a directed graph, known as the file hierarchy, rooted at /. These files can be spread out over several underlying devices. The **mount** command shall attach the file system found on some underlying device to the file hierarchy.

Options

-v

invoke verbose mode. The **mount** command shall provide diagnostic messages on `stdout`.

-a

mount all file systems (of the given types) mentioned in `/etc/fstab`.

-F

If the **-a** option is also present, fork a new incarnation of **mount** for each device to be mounted. This will do the mounts on different devices or different NFS servers in parallel.

-f

cause everything to be done except for the actual system call; if it's not obvious, this 'fakes' mounting the file system.

-n

mount without writing in `/etc/mtab`. This is necessary for example when `/etc` is on a read-only file system.

-s

ignore **mount** options not supported by a file system type. Not all file systems support this option.

-r

mount the file system read-only. A synonym is `-o ro`.

-w

mount the file system read/write. (default) A synonym is `-o rw`.

-L label

If the file `/proc/partitions` is supported, mount the partition that has the specified label.

-U uuid

If the file `/proc/partitions` is supported, mount the partition that has the specified uuid.

-t vfstype

indicate a file system type of *vfstype*.

More than one type may be specified in a comma separated list. The list of file system types can be prefixed with `no` to specify the file system types on which no action should be taken.

-o

options are specified with a `-o` flag followed by a comma-separated string of options. Some of these options are only useful when they appear in the `/etc/fstab` file. The following options apply to any file system that is being mounted:

async

perform all I/O to the file system asynchronously.

atime

update inode access time for each access. (default)

auto

in `/etc/fstab`, indicate the device is mountable with `-a`.

defaults

use default options: `rw, suid, dev, exec, auto, nouser, async`.

dev

interpret character or block special devices on the file system.

exec

permit execution of binaries.

noatime

do not update file access times on this file system.

noauto

in `/etc/fstab`, indicates the device is only explicitly mountable.

nodev

do not interpret character or block special devices on the file system.

noexec

do not allow execution of any binaries on the mounted file system.

nosuid

do not allow set-user-identifier or set-group-identifier bits to take effect.

nouser

forbid an unprivileged user to mount the file system. (default)

remount

remount an already-mounted file system. This is commonly used to change the mount options for a file system, especially to make a read-only file system writable.

ro

mount the file system read-only.

rw

mount the file system read-write.

suid

allow set-user-identifier or set-group-identifier bits to take effect.

sync

do all I/O to the file system synchronously.

user

allow an unprivileged user to mount the file system. This option implies the options `noexec`, `nosuid`, `nodev` unless overridden by subsequent options.

LSB Deprecated Options

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

-V

output version and exit.

msgfmt

Name

msgfmt — create a message object from a message file

Synopsis

msgfmt [options...] *filename*...

Description

The **msgfmt** command generates a binary message catalog from a textual translation description. Message catalogs, or message object files, are stored in files with a `.mo` extension.

Note: The format of message object files is not guaranteed to be portable. Message catalogs should always be generated on the target architecture using the **msgfmt** command.

The source message files, otherwise known as portable object files, have a `.po` extension.

The *filename* operands shall be portable object files. The `.po` file contains messages to be displayed to users by system utilities or by application programs. The portable object files are text files, and the messages in them can be rewritten in any language supported by the system.

If any *filename* is `-`, a portable object file shall be read from the standard input.

The **msgfmt** command interprets data as characters according to the current setting of the `LC_CTYPE` locale category.

Options

`-c`

`--check`

Detect and diagnose input file anomalies which might represent translation errors. The `msgid` and `msgstr` strings are studied and compared. It is considered abnormal that one string starts or ends with a newline while the other does not.

If the message is flagged as `c-format` (see Comment Handling), check that the `msgid` string and the `msgstr` translation have the same number of `%` format specifiers, with matching types.

`-D directory`

`--directory=directory`

Add *directory* to list for input files search. If *filename* is not an absolute pathname and *filename* cannot be opened, search for it in *directory*. This option may be repeated. Directories shall be searched in order, with the leftmost *directory* searched first.

`-f`

`--use-fuzzy`

Use entries marked as *fuzzy* in output. If this option is not specified, such entries are not included into the output. See Comment Handling below.

`-o output-file`

`--output-file=output-file`

Specify the output file name as *output-file*. If multiple domains or duplicate msgids in the *.po* file are present, the behavior is unspecified. If *output-file* is *-*, output is written to standard output.

`--strict`

Ensure that all output files have a *.mo* extension. Output files are named either by the *-o* (or *--output-file*) option, or by domains found in the input files.

`-v`

`--verbose`

Print additional information to the standard error, including the number of translated strings processed.

Operands

The *filename* operands are treated as portable object files. The format of portable object files is defined in EXTENDED DESCRIPTION.

Standard Input

The standard input is not used unless a *filename* operand is specified as *"-"*.

Environment Variables

LANGUAGE

Specifies one or more locale names.

LANG

Specifies locale name.

LC_ALL

Specifies locale name for all categories. If defined, overrides LANG, LC_CTYPE and LC_MESSAGES.

LC_CTYPE

Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).

LC_MESSAGES

Specifies messaging locale, and if present overrides LANG for messages.

Standard Output

The standard output is not used unless the option-argument of the *-o* option is specified as *-*.

Extended Description

The format of portable object files (.po files) is defined as follows. Each .po file contains one or more lines, with each line containing either a comment or a statement. Comments start the line with a hash mark (#) and end with the newline character. Empty lines, or lines containing only white-space, shall be ignored. Comments can in certain circumstances alter the behavior of **msgfmt**. See Comment Handling below for details on comment processing. The format of a statement is:

```
directive value
```

Each `directive` starts at the beginning of the line and is separated from `value` by white space (such as one or more space or tab characters). The `value` consists of one or more quoted strings separated by white space. If two or more strings are specified as `value`, they are normalized into single string using the string normalization syntax specified in ISO C (1999). The following directives are supported:

```
domain domainname
```

```
msgid message_identifier
```

```
msgid_plural untranslated_string_plural
```

```
msgstr message_string
```

```
msgstr[n] message_string
```

The behavior of the `domain` directive is affected by the options used. See **OPTIONS** for the behavior when the `-o` option is specified. If the `-o` option is not specified, the behavior of the `domain` directive is as follows:

1. All `msgids` from the beginning of each .po file to the first `domain` directive are put into a default message object file, `messages` (or `messages.mo` if the `--strict` option is specified).
2. When **msgfmt** encounters a `domain domainname` directive in the .po file, all following `msgids` until the next `domain` directive are put into the message object file `domainname` (or `domainname.mo` if `--strict` option is specified).
3. Duplicate `msgids` are defined in the scope of each domain. That is, a `msgid` is considered a duplicate only if the identical `msgid` exists in the same domain.
4. All duplicate `msgids` are ignored.

The `msgid` directive specifies the value of a message identifier associated with the directive that follows it. The `msgid_plural` directive specifies the plural form message specified to the plural message handling functions `ngettext()`, `dngettext()` or `dcngettext()`. The `message_identifier` string identifies a target string to be used at retrieval time. Each statement containing a `msgid` directive shall be followed by a statement containing a `msgstr` directive or `msgstr[n]` directives.

The `msgstr` directive specifies the target string associated with the `message_identifier` string declared in the immediately preceding `msgid` directive.

The `msgstr[n]` (where $n=0, 1, 2, \dots$) directive specifies the target string to be used with plural form handling functions `ngettext()`, `dngettext()` and `dcngettext()`.

Message strings can contain the following escape sequences:

Table 17-3 Escape Sequences

<code>\n</code>	newline
<code>\t</code>	tab
<code>\v</code>	vertical tab
<code>\b</code>	backspace
<code>\r</code>	carriage return
<code>\f</code>	formfeed
<code>\\</code>	backslash
<code>\"</code>	double quote
<code>\ddd</code>	octal bit pattern
<code>\xHH</code>	hexadecimal bit pattern

Comment Handling

Comments are introduced by a `#`, and continue to the end of the line. The second character (i.e. the character following the `#`) has special meaning. Regular comments should follow a space character. Other comment types include:

```
# normal-comments
#. automatic-comments
#: reference...
#, flag
```

Automatic and reference comments are typically generated by external utilities, and are not specified by the LSB. The **msgfmt** command shall ignore such comments.

Note: Portable object files may be produced by unspecified tools. Some of the comment types described here may arise from the use of such tools. It is beyond the scope of this specification to describe these tools.

The `#,` comments require one or more flags separated by the comma (,) character. The following flags can be specified:

fuzzy

This flag shows that the following `msgstr` string might not be a correct translation. Only the translator (i.e. the individual undertaking the translation) can judge if the translation requires further modification, or is acceptable as is. Once satisfied with the translation, the translator then removes this fuzzy flag.

If this flag is specified, the **msgfmt** utility will not generate the entry for the immediately following **msgid** in the output message catalog, unless the **--use-fuzzy** is specified.

c-format

no-c-format

The **c-format** flag indicates that the **msgid** string is used as format string by **printf()**-like functions. If the **c-format** flag is given for a string the **msgfmt** utility may perform additional tests to check the validity of the translation.

Plurals

The **msgid** entry with empty string ("") is called the header entry and is treated specially. If the message string for the header entry contains **nplurals=value**, the value indicates the number of plural forms. For example, if **nplurals=4**, there are 4 plural forms. If **nplurals** is defined, there should be a **plural=expression** on the same line, separated by a semicolon (;) character. The expression is a C language expression to determine which version of **msgstr[n]** to be used based on the value of **n**, the last argument of **ngettext()**, **dngettext()** or **dcngettext()**. For example:

```
nplurals=2; plural=n == 1 ? 0 : 1
```

indicates that there are 2 plural forms in the language; **msgstr[0]** is used if **n == 1**, otherwise **msgstr[1]** is used. Another example:

```
nplurals=3; plural=n==1 ? 0 : n==2 ? 1 : 2
```

indicates that there are 3 plural forms in the language; **msgstr[0]** is used if **n == 1**, **msgstr[1]** is used if **n == 2**, otherwise **msgstr[2]** is used.

If the header entry contains **charset=codeset** string, the **codeset** is used to indicate the codeset to be used to encode the message strings. If the output string's codeset is different from the message string's codeset, codeset conversion from the message strings's codeset to the output string's codeset will be performed upon the call of **gettext()**, **dgettext()**, **dcgettext()**, **ngettext()**, **dngettext()**, and **dcngettext()**. The output string's codeset is determined by the current locale's codeset (the return value of **nl_langinfo(CODESET)**) by default, and can be changed by the call of **bind_textdomain_codeset()**.

Exit Status

The following exit values are returned:

0

Successful completion.

>0

An error occurred.

Application Usage

Neither **msgfmt** nor any `gettext()` function imposes a limit on the total length of a message. Installing message catalogs under the C locale is pointless, since they are ignored for the sake of efficiency.

Examples

Example 1: Examples of creating message objects from message files.

In this example `module1.po`, `module2.po` and `module3.po` are portable message object files.

```
example% cat module1.po

# default domain "messages"

msgid "message one"
msgstr "mensaje número uno"

#

domain "help_domain"

msgid "help two"
msgstr "ayuda número dos"

#

domain "error_domain"

msgid "error three"
msgstr "error número tres"

example% cat module2.po

# default domain "messages"

msgid "message four"
msgstr "mensaje número cuatro"

#

domain "error_domain"

msgid "error five"
msgstr "error número cinco"

#

domain "window_domain"

msgid "window six"
msgstr "ventana número seises"

example% cat module3.po

# default domain "messages"

msgid "message seven"
```

```
msgstr "mensaje número siete"
```

The following command will produce the output files `messages`, `help_domain`, and `error_domain`.

```
example% msgfmt module1.po
```

The following command will produce the output files `messages.mo`, `help_domain.mo`, `error_domain.mo`, and `window_domain.mo`.

```
example% msgfmt module1.po module2.po
```

The following example will produce the output file `hello.mo`.

```
example% msgfmt -o hello.mo module3.po
```

newgrp

Name

`newgrp` — change group ID

Synopsis

newgrp [`group`]

Description

The **newgrp** command is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

The `-l` option specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009) need not be supported.

od**Name**

od — dump files in octal and other formats

Synopsis

```
od [-abcdfilox] [-w width | --width=width] [-v] [-A address_base] [-j skip]
[-n count] [-t type_string] [file...] od --traditional [options] [file]
[[+]offset [.] [b]] [[+]label [.] [b]]
```

Description

The **od** command shall provide all of the mandatory functionality specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with extensions and differences to the XSI optional behavior as listed below.

Extensions and Differences

-s

unspecified behavior.

Note: Applications wishing to achieve the POSIX 1003.1-2008 (ISO/IEC 9945-2009) behavior for **-s** should instead use **-t d2**.

-w*width*, **--width**[=*width*]

each output line is limited to *width* bytes from the input.

--traditional

accepts arguments in traditional form, see Traditional Usage below.

Note: The XSI optional behavior for offset handling described in POSIX 1003.1-2008 (ISO/IEC 9945-2009) is not supported unless the **--traditional** option is also specified.

Pre-POSIX and XSI Specifications

The LSB supports mixing options between the mandatory and XSI optional synopsis forms in POSIX 1003.1-2008 (ISO/IEC 9945-2009). The LSB shall support the following options:

-a

is equivalent to **-t a**, selects named characters.

-b

is equivalent to **-t o1**, selects octal bytes.

-c

is equivalent to **-t c**, selects characters.

-d

is equivalent to **-t u2**, selects unsigned decimal two byte units.

-f

is equivalent to `-t fF`, selects floats.

-i

is equivalent to `-t d2`, selects decimal two byte units.

Note: This usage may change in future releases; portable applications should use `-t d2`.

-l

is equivalent to `-t d4`, selects decimal longs.

-o

is equivalent to `-t o2`, selects octal two byte units.

-x

is equivalent to `-t x2`, selects hexadecimal two byte units.

Note that the XSI option `-s` need not be supported.

Traditional Usage

If the `--traditional` option is specified, there may be between zero and three operands specified.

If no operands are specified, then **od** shall read the standard input.

If there is exactly one operand, and it is an offset of the form `[+]offset[.][b]`, then it shall be interpreted as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). The file to be dumped shall be the standard input.

If there are exactly two operands, and they are both of the form `[+]offset[.][b]`, then the first shall be treated as an offset (as above), and the second shall be a label, in the same format as the offset. If a label is specified, then the first output line produced for each input block shall be preceded by the input offset, cumulative across input files, of the next byte to be written, followed by the label, in parentheses. The label shall increment in the same manner as the offset.

If there are three operands, then the first shall be the file to dump, the second the offset, and the third the label.

Note: Recent versions of **coreutils** contain an **od** utility that conforms to POSIX 1003.1-2008 (ISO/IEC 9945-2009). However, in April 2005, this version was not in widespread use. A future version of this specification may remove the differences.

passwd

Name

passwd — change user password

Synopsis

passwd [-x max] [-n min] [-w warn] [-i inact] name **passwd** {-l | -u} name

Description

passwd changes authentication information for user and group accounts, including passwords and password expiry details, and may be used to enable and disable accounts. Only a user with appropriate privilege may change the password for other users or modify the expiry information.

Options

-x max

sets the maximum number of days a password remains valid.

-n min

sets the minimum number of days before a password may be changed.

-w warn

sets the number of days warning the user will receive before their password will expire.

-i inactive

disables an account after the password has been expired for the given number of days.

-l

disables an account by changing the password to a value which matches no possible encrypted value.

-u

re-enables an account by changing the password back to its previous value.

patch

Name

`patch` — apply a diff file to an original

Description

patch is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with extensions as listed below.

Extensions

`--binary`

reads and write all files in binary mode, except for standard output and /dev/tty. This option has no effect on POSIX-compliant systems.

`-u, --unified`

interprets the patch file as a unified context diff.

pidof

Name

`pidof` — find the process ID of a running program

Synopsis

pidof [-s] [-x] [-o omitpid...] program...

Description

Return the process ID of a process which is running the program named on the command line.

The **pidof** command is a system administration utility, see Path For System Administration Utilities.

Options

`-s`

instructs the program to only return one pid.

`-x`

causes the program to also return process id's of shells running the named scripts.

`-o`

omits processes with specified process id.

remove_initd

Name

`remove_initd` — clean up init script system modifications introduced by `install_initd`

Synopsis

```
/usr/lib/lsb/remove_initd initd_file
```

Description

remove_initd processes the removal of the modifications made to a distribution's init script system by the **install_initd** program. This cleanup is performed in the `preuninstall` script of a package; however, the package manager is still responsible for removing the script from the repository. See also Installation and Removal of Init Scripts.

renice

Name

`renice` — alter priority of running processes

Description

renice is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

`-n` increment

has unspecified behavior.

sed

Name

`sed` — stream editor

Description

sed is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

LSB Differences

Certain aspects of internationalized regular expressions are optional; see Regular Expressions.

sendmail

Name

sendmail — an electronic mail transport agent

Synopsis

```
/usr/sbin/sendmail [options] [address...]
```

Description

To deliver electronic mail (email), implementations shall provide the interface described here as a command named **sendmail**. This interface shall be the default delivery method for applications needing to transmit an email message.

This program sends an email message to one or more recipients, routing the message as necessary. This program is not intended as a user interface routine.

With no options, **sendmail** reads its standard input up to an end-of-file or a line consisting only of a single dot and sends a copy of the message found there to all of the addresses listed. It determines the network(s) to use based on the syntax and contents of the addresses.

If an address is preceded by a backslash, '\', it is unspecified whether the address is subject to local alias expansion.

The format of messages shall be as defined in RFC 2822:Internet Message Format.

Note: The required name **sendmail** was chosen for historical reasons, but the behaviors specified here are intended to reflect functionality which can be provided by a number of other implementations such as **smail**, **exim** and others. This specification does not require that the specific **sendmail** program be the implementation chosen to provide this functionality.

Options

-bm

read mail from standard input and deliver it to the recipient addresses. This is the default mode of operation.

-bp

If the user has sufficient privilege, list information about messages currently in the mail queue.

-bs

use the SMTP protocol as described in RFC 2821:Simple Mail Transfer Protocol; read SMTP commands on standard input and write SMTP responses on standard output.

In this mode, **sendmail** shall accept `\r\n` (CR-LF), as required by RFC 2821:Simple Mail Transfer Protocol, and `\n` (LF) line terminators.

-F fullname

explicitly set the full name of the sender for incoming mail unless the message already contains a `From:` message header.

If the user running **sendmail** is not sufficiently trusted, then the actual sender may be indicated in the message, depending on the configuration of the agent.

-f name

explicitly set the envelope sender address for incoming mail. If there is no `From:` header, the address specified in the `From:` header will also be set.

If the user running **sendmail** is not sufficiently trusted, then the actual sender shall be indicated in the message.

-i

ignore dots alone on lines by themselves in incoming messages. If this options is not specified, a line consisting of a single dot shall terminate the input. If `-bs` is also used, the behavior is unspecified.

-odb

deliver any mail in background, if supported; otherwise ignored.

-odf

deliver any mail in foreground, if supported; otherwise ignored.

-oem or -em

mail errors back to the sender. (default)

-oep or -ep

write errors to the standard error output.

-oeq or -eq

do not send notification of errors to the sender. This only works for mail delivered locally.

-oi

is equivalent to `-i`.

-om

indicate that the sender of a message should receive a copy of the message if the sender appears in an alias expansion. Ignored if aliases are not supported.

-t

read the message to obtain recipients from the `To:`, `Cc:`, and `Bcc:` headers in the message instead of from the command arguments. If a `Bcc:` header is present, it is removed from the message unless there is no `To:` or `Cc:` header, in which case a `Bcc:` header with no data is created, in accordance with RFC 2822:Internet Message Format.

If there are any operands, the recipients list is unspecified.

This option may be ignored when not in `-bm` mode (the default).

Note: It is recommended that applications use as few options as necessary, none if possible.

Exit status

The **sendmail** command returns an exit status indicating the results of the operation. The exit codes are as defined in `<sysexits.h>`.

EX_OK

successful completion on all addresses. Note this does not necessarily indicate successful delivery.

EX_NOUSER

The user specified did not exist.

EX_UNAVAILABLE

A required service or resource was unavailable.

EX_USAGE

Command was invoked incorrectly, such as wrong number of arguments, syntax error in arguments, bad flags.

EX_SOFTWARE

An internal software error was detected. Includes bad arguments.

EX_OSERROR

An operating system error was detected. Includes failure to execute `fork()` or `pipe()`.

EX_NOHOST

The host specified did not exist.

EX_TEMPFAIL

Temporary failure. Used to indicate the message could not be sent immediately, perhaps because a connection could not be created, but the request can be retried.

seq

Name

seq — generate a sequence of numbers

Synopsis

/usr/bin/seq [-f *fmt_str*] [-s *sep_str*] [*first_num*] [*inc_num*] *last_num*

Description

The **seq** command shall output a sequence of numbers from *first_num* to *last_num*, stepping by the increment *inc_num*. The *first_num* and *last_num* parameters may be omitted, and default to 1 even when *first_num* is greater than *last_num*. Floating-point values may be specified for *first_num*, *inc_num*, and *last_num*.

The *fmt_str* parameter is a floating point format string like the one used for the `printf()` function in C.

The *sep_str* parameter string separates the values that are output. The default is a newline character (`\n`).

Note: If *first_num* is less than *last_num* and *inc_num* is negative, or *first_num* is greater than *last_num* and *inc_num* is positive, **seq** shall not generate any output.

Standard Options

-f *fmt_str*

Format the numbers in the output sequence according to *fmt_str*, a floating point format string like the one used for the `printf()` function in C.

-s *sep_str*

Separate the numbers in the output sequence with *sep_str*. The default separator string is a newline character (`\n`).

first_num

The first number in the output sequence. Defaults to 1. May be a floating point value.

inc_num

The increment for the output sequence. Defaults to 1. May be a floating point value.

last_num

The last number in the output sequence. May be a floating point value.

sh

Name

sh — shell, the standard command language interpreter

Description

The **sh** utility shall behave as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with extensions listed below.

Shell Invocation

The shell shall support an additional option, `-l` (the letter *ell*). If the `-l` option is specified, or if the first character of argument zero (the command name) is a `'-'`, this invocation of the shell is a *login shell*.

An interactive shell, as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), that is also a login shell, or any shell if invoked with the `-l` option, shall, prior to reading from the input file, first read and execute commands from the file `/etc/profile`, if that file exists, and then from a file called `~/.profile`, if such a file exists.

Note: This specification requires that the **sh** utility shall also read and execute commands in its current execution environment from all the shell scripts in the directory `/etc/profile.d`. Such scripts are read and executed as a part of reading and executing `/etc/profile`.

shutdown

Name

shutdown — shut the system down

Synopsis

```
/sbin/shutdown [-t sec] [-h | -r] [-akfF] time [warning-  
message]/sbin/shutdown -c [warning-message]
```

Description

The **shutdown** command shall shut the system down in a secure way (first synopsis), or cancel a pending shutdown (second synopsis). When the shutdown is initiated, all logged-in users shall be notified immediately that the system is going down, and users shall be prevented from logging in to the system. The *time* specifies when the actual shutdown shall commence. See below for details. At the specified time all processes are first notified that the system is going down by the signal SIGTERM. After an interval (see *-t*) all processes shall be sent the signal SIGKILL. If neither the *-h* or the *-r* argument is specified, then the default behavior shall be to take the system to a runlevel where administrative tasks can be run. See also Run Levels.

Note: This is sometimes referred to as "single user mode".

The *-h* and *-r* options are mutually exclusive. If either the *-h* or *-r* options are specified, the system shall be halted or rebooted respectively.

Standard Options

-a

use access control. See below.

-t sec

tell the system to wait *sec* seconds between sending processes the warning and the kill signal, before changing to another runlevel. The default period is unspecified.

-k

do not really shutdown; only send the warning messages to everybody.

-r

reboot after shutdown.

-h

halt after shutdown. Actions after halting are unspecified (e.g. power off).

-f

advise the system to skip file system consistency checks on reboot.

-F

advise the system to force file system consistency checks on reboot.

-c

cancel an already running **shutdown**.

time

specify when to shut down.

The time argument shall have the following format: [now | [+]mins | hh:mm] If the format is hh:mm, hh shall specify the hour (1 or 2 digits) and mm is the minute of the hour (exactly two digits), and the shutdown shall commence at the next occurrence of the specified time. If the format is mins (or +mins), where mins is a decimal number, shutdown shall commence in the specified number of minutes. The word now is an alias for +0.

warning-message

specify a message to send to all users.

Access Control

If the **shutdown** utility is invoked with the **-a** option, it shall check that an authorized user is currently logged in on the system console. Authorized users are listed, one per line, in the file `/etc/shutdown.allow`. Lines in this file that begin with a '#' or are blank shall be ignored.

Note: The intent of this scheme is to allow a keyboard sequence entered on the system console (e.g. CTRL-ALT-DEL, or STOP-A) to automatically invoke **shutdown -a**, and can be used to prevent unauthorized users from shutting the system down in this fashion.

su**Name**

su — change user ID

Synopsis

```
su [options] [-] [username [ARGS]]
```

Description

The **su** command shall start a shell running with the real and effective user and group IDs of the user *username*. If *username* is not specified, **su** shall default to an unspecified user with all appropriate privileges. If the *-s* or *--shell* is not specified, the shell to be invoked shall be that specified for *username* in the user database (see `getpwnam()`), or `/bin/sh` if there is no shell specified in the user database.

If the *-* option is specified, or if the first operand is *-*, the environment for the shell shall be initialized as if the new shell was a login shell (see Shell Invocation).

If the invoking user does not have appropriate privileges, the **su** command shall prompt for a password and validate this before continuing. Invalid passwords shall produce an error message. The **su** command shall log in an unspecified manner all invocations, whether successful or unsuccessful.

Any operands specified after the *username* shall be passed to the invoked shell.

If the option *-* is not specified, and if the first operand is not *-*, the environment for the new shell shall be initialized from the current environment. If none of the *-m*, *-p*, or *--preserve-environment* options are specified, the environment may be modified in unspecified ways before invoking the shell. If any of the *-m*, *-p*, or *--preserve-environment* options are specified, the environment shall not be altered.

Note: Although the **su** command shall not alter the environment, the invoked shell may still alter it before it is ready to interpret any commands.

Standard Options

-

the invoked shell shall be a login shell.

-c command, *--command=command*

Invoke the shell with the option *-c command*.

-m, *-p*, *--preserve-environment*

The current environment shall be passed to the invoked shell. If the environment variable `SHELL` is set, it shall specify the shell to invoke, if it matches an entry in `/etc/shells`. If there is no matching entry in `/etc/shells`, this option shall be ignored if the *-* option is also specified, or if the first operand is *-*.

-s shell, *--shell=shell*

Invoke *shell* as the command interpreter. The shell specified shall be present in */etc/shells*.

sync

Name

sync — flush file system buffers

Synopsis

sync

Description

Force changed blocks to disk, update the super block.

tar

Name

tar — file archiver

Description

tar is as specified in SUSv2, but with differences as listed below.

Differences

Some elements of the Pattern Matching Notation are optional; see Pattern Matching Notation.

-h

doesn't dump symlinks; dumps the files they point to.

-Z

filters the archive through **gzip**.

umount

Name

`umount` — unmount file systems

Synopsis

```
umount [-hV]umount -a [-nrv] [-t vfstype]umount [-nrv] device | dir
```

Description

umount detaches the file system(s) mentioned from the file hierarchy. A file system is specified by giving the directory where it has been mounted.

Standard Options

-v

invokes verbose mode.

-n

unmounts without writing in `/etc/mtab`.

-r

tries to remount read-only if unmounting fails.

-a

unmounts all of the file systems described in `/etc/mtab` except for the `proc` file system.

-t vfstype

indicates that the actions should only be taken on file systems of the specified type. More than one type may be specified in a comma separated list. The list of file system types can be prefixed with `no` to specify the file system types on which no action should be taken.

-f

forces unmount (in case of an unreachable NFS system).

LSB Deprecated Options

The behaviors specified in this section are expected to disappear from a future version of the LSB; applications should only use the non-LSB-deprecated behaviors.

-V

print version and exits.

useradd

Name

useradd — create a new user or update default new user information

Synopsis

```
useradd [-c comment] [-d home_dir] [-g initial_group] [-G group...] [-m [-k skeleton_dir]] [-p passwd] [-r] [-s shell] [-u uid [-o]] login useradd -D [-g default_group] [-b default_home] [-s default_shell]
```

Description

When invoked without the `-D` option, and with appropriate privilege, **useradd** creates a new user account using the values specified on the command line and the default values from the system. The new user account will be entered into the system files as needed, the home directory will be created, and initial files copied, depending on the command line options. If the group named *group* does not exist, or the user names *login* already exists, or the user ID *uid* is already in use and no `-o` option is specified, then **useradd** shall issue a diagnostic message and exit with a non-zero exit status.

When invoked with the `-D` option, **useradd** will either display the current default values, or, with appropriate privilege, update the default values from the command line. If no options are specified, **useradd** displays the current default values.

The **useradd** command is a system administration utility, see Path For System Administration Utilities.

Standard Options

`-c comment`

specifies the new user's password file comment field value.

`-d home_dir`

creates the new user using *home_dir* as the value for the user's login directory. The default is to append the login name to *default_home* and use that as the login directory name.

`-g initial_group`

specifies the group name or number of the user's initial login group. The group name shall exist. A group number shall refer to an already existing group. If `-g` is not specified, the implementation will follow the normal user default for that system. This may create a new group or choose a default group that normal users are placed in. Applications which require control of the groups into which a user is placed should specify `-g`.

`-G group[,...]`

specifies a list of supplementary groups which the user is also a member of. Each group is separated from the next by a comma, with no intervening whitespace. The groups are subject to the same restrictions as the group given with the `-g` option. The default is for the user to belong only to the initial group.

`-m [-k skeleton_dir]`

specifies the user's home directory will be created if it does not exist. The files contained in `skeleton_dir` will be copied to the home directory if the `-k` option is used, otherwise the files contained in `/etc/skel` will be used instead. Any directories contained in `skeleton_dir` or `/etc/skel` will be created in the user's home directory as well. The `-k` option is only valid in conjunction with the `-m` option. The default is to not create the directory and to not copy any files.

`-p passwd`

is the encrypted password, as returned by `crypt()`. The default is to disable the account.

`-r`

creates a system account, that is, a user with a User ID in the range reserved for system account users. If there is not a User ID free in the reserved range the command will fail.

`-s shell`

specifies the name of the user's login shell. The default is to leave this field blank, which causes the system to select the default login shell.

`-u uid [-o]`

specifies the numerical value of the user's ID. This value shall be unique, unless the `-o` option is used. The value shall be non-negative. The default is the smallest ID value greater than 499 which is not yet used.

Change Default Options

`-b default_home`

specifies the initial path prefix for a new user's home directory. The user's name will be affixed to the end of `default_home` to create the new directory name if the `-d` option is not used when creating a new account.

`-g default_group`

specifies the group name or ID for a new user's initial group. The named group shall exist, and a numerical group ID shall have an existing entry.

`-s default_shell`

specifies the name of the new user's login shell. The named program will be used for all future new user accounts.

`-c comment`

specifies the new user's password file comment field value.

Application Usage

The `-D` option will typically be used by system administration packages. Most applications should not change defaults which will affect other applications and users.

userdel

Name

`userdel` — delete a user account and related files

Synopsis

`userdel` [-r] *login*

Description

Delete the user account named *login*. If there is also a group named *login*, this command may delete the group as well, or may leave it alone. If the user named *login* does not exist or is currently logged in, **userdel** shall issue a diagnostic message and exit with a non-zero exit status.

The **userdel** command is a system administration utility, see Path For System Administration Utilities.

Options

`-r`

removes files in the user's home directory along with the home directory itself. Files located in other file system will have to be searched for and deleted manually.

usermod

Name

usermod — modify a user account

Synopsis

```
usermod [-c comment] [-d home_dir [ -m]] [-g initial_group] [-G group  
[,...]] [-l login_name] [-p passwd] [-s shell] [-u uid [ -o]] login
```

Description

The **usermod** command shall modify an entry in the user account database.

The **usermod** command is a system administration utility, see Path For System Administration Utilities.

Options

-c comment

specifies the new value of the user's password file comment field.

-d home_dir

specifies the user's new login directory. If the -m option is given the contents of the current home directory will be moved to the new home directory, which is created if it does not already exist.

-g initial_group

specifies the group name or number of the user's new initial login group. The group name shall exist. A group number shall refer to an already existing group.

-G group,[...]

specifies a list of supplementary groups which the user is also a member of. Each group is separated from the next by a comma, with no intervening whitespace. The groups are subject to the same restrictions as the group given with the -g option. If the user is currently a member of a group which is not listed, the user will be removed from the group.

-l login_name

changes the name of the user from login to login_name. Nothing else is changed. In particular, the user's home directory name should probably be changed to reflect the new login name.

-p passwd

is the encrypted password, as returned by crypt(3).

-s shell

specifies the name of the user's new login shell. Setting this field to blank causes the system to select the default login shell.

-u uid [-o]

specifies the numerical value of the user's ID. This value shall be unique, unless the `-o` option is used. The value shall be non-negative. Any files which the user owns and which are located in the directory tree rooted at the user's home directory will have the file user ID changed automatically. Files outside of the user's home directory shall be altered manually.

xargs

Name

`xargs` — build and execute command lines from standard input

Description

`xargs` is as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), but with differences as listed below.

Differences

`-E`

has unspecified behavior.

`-I`

has unspecified behavior.

`-L`

has unspecified behavior.

Note: These options have been implemented in **findutils-4.2.9**, but this version of the utilities is not in widespread use as of April 2005. However, future versions of this specification will require support for these arguments.

zcat

Name

`zcat` — uncompress files to standard output

Description

The `zcat` utility shall behave as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), with differences listed below.

The Filesystem Hierarchy Standard requires that if `zcat` exists, it must be a symbolic or hard link to `/bin/gzip`. This specification additionally allows `zcat` to be a wrapper script which calls `gzip -c -d`.

Differences

The `zcat` utility shall write to standard output the uncompressed form of files that have been compressed using any of the compression methods supported by the `gzip` utility. It is the equivalent of `gzip -c -d`. Input files are not affected.

VII Execution Environment

18 File System Hierarchy

An LSB conforming implementation shall provide the mandatory portions of the file system hierarchy specified in the Filesystem Hierarchy Standard (FHS), together with any additional requirements made in this specification.

An LSB conforming application shall conform to the Filesystem Hierarchy Standard.

The FHS allows many components or subsystems to be optional. An application shall check for the existence of an optional component before using it, and should behave in a reasonable manner if the optional component is not present.

The FHS requirement to locate the operating system kernel in either `/` or `/boot` does not apply if the operating system kernel does not exist as a file in the file system.

The FHS specifies certain behaviors for a variety of commands if they are present (for example, **ping** or **python**). However, conforming applications shall not rely on any commands beyond those required by this specification. The mere existence of a command may not be used as an indication that the command behaves in any particular way.

The following directories or links need not be present: `/etc/X11` `/usr/bin/X11` `/usr/lib/X11` `/proc`

18.1 `/dev`: Device Files

The devices described in Chapter 6. "Operating System Specific Annex", Section 6.1. "Linux", subsection 6.1.3. `/dev`: Devices and special files" in the Filesystem Hierarchy Standard are required on an LSB conforming system. Other devices may also exist in `/dev`. Device names may exist as symbolic links to other device nodes located in `/dev` or subdirectories of `/dev`. There is no requirement concerning major/minor number values.

18.2 `/etc`: Host-specific system configuration

In addition to the requirements for `/etc` in the Filesystem Hierarchy Standard, an LSB conforming system shall also provide the following directories or symbolic links to directories:

`/etc/cron.d`

A directory containing extended **crontab** files; see Cron Jobs.

`/etc/cron.daily`

A directory containing shell scripts to be executed once a day; see Cron Jobs.

`/etc/cron.hourly`

A directory containing shell scripts to be executed once per hour; see Cron Jobs.

`/etc/cron.monthly`

A directory containing shell scripts to be executed once per month; see Cron Jobs.

`/etc/cron.weekly`

A directory containing shell scripts to be executed once a week; see Cron Jobs.

`/etc/init.d`

A directory containing system initialization scripts; see Installation and Removal of Init Scripts.

`/etc/profile.d`

A directory containing shell scripts. Script names should follow the same conventions as specified for cron jobs (see Cron Jobs, but should have the suffix `.sh`). The behavior is unspecified if a script is installed in this directory that does not have the suffix `.sh`.

The **sh** utility shall read and execute commands in its current execution environment from all the shell scripts in this directory that have the suffix `.sh` when invoked as an interactive login shell, or if the `-l` (the letter *ell*) is specified (see Shell Invocation).

Future Directions: These directories are required at this version of the LSB since there is not yet an agreed method for abstracting the implementation so that applications need not be aware of these locations during installation.

18.2.1 File Naming Conventions

Conforming implementations and applications installing files into any of the above locations under `/etc` may only use filenames from the following managed namespaces:

- Assigned names. Such names must be chosen from the character set `[a-z0-9]`. In order to avoid conflicts these names shall be registered. This specification establishes a registry of provider, package and script names which is maintained at the Linux Assigned Names and Numbers Authority (LANANA). See www.lanana.org (<http://www.lanana.org>) to register names or look up already registered names.

Note: Commonly used names should be registered to avoid conflicts and promote name reuse across distributions. Project developers are encouraged to reserve names with the LANANA as early as possible as registration is on a first-come, first-served basis.

- Hierarchical names. Script names in this category take the form: `<hier1>-<hier2>-...-<name>`, where `name` is taken from the character set `[a-z0-9]`, and where there may be one or more `<hier-n>` components. `<hier1>` may either be an LSB provider name registered with the LANANA, or it may be a domain name registered to the provider in the DNS system, containing at least one `'.'` (e.g. `"debian.org"`, `"staroffice.sun.com"`). The LSB provider name registered with the LANANA shall only consist of the ASCII characters `[a-z0-9]`.
- Reserved names. Names that begin with the character `'_'` are reserved for distribution use only. Names in this form should be used for essential system packages only.

Note: As this specification cannot enforce rules for applications which do not choose to conform to it, conforming applications need to be aware that the managed namespaces may have been polluted with unregistered filenames and should check for namespace collisions and take appropriate steps if they occur.

In general, if a package or system script is likely to be used on multiple systems, the package developers or the distribution should register the name through the LANANA, and distributions should strive to use the same name whenever possible. For applications which may not be essential or may not be commonly installed, the hierarchical namespace may be more appropriate. An advantage to the hierarchical namespace is that there is no need to consult with the LANANA before using a specific name.

Short names are highly desirable, since system administrators may wish to manually start and stop services. Given this, they should be standardized on a per-package basis. This is the rationale behind having the LANANA organization assign these names. The LANANA may be called upon to handle other namespace issues, such as package/prerequisites naming.

18.3 User Accounting Databases

The Filesystem Hierarchy Standard specifies two optional locations for user accounting databases used by the `getutent()`, `getutent_r()`, `getutxent()`, `getutxid()`, `getutxline()`, and `pututxline()` functions. These are `/var/run/utmp` and `/var/run/wtmp`.

The LSB does not specify the format or structure of these files, or even if they are files at all. They should be used only as "magic cookies" to the `utmpname()` function.

18.4 Path For System Administration Utilities

Certain utilities used for system administration (and other privileged commands) may be stored in `/sbin`, `/usr/sbin`, and `/usr/local/sbin`. Applications requiring to use commands identified as system administration utilities should add these directories to their `PATH`. By default, as described in POSIX 1003.1-2008 (ISO/IEC 9945-2009), standard utilities shall be found on the `PATH` returned by `getconf PATH` (or **command -p getconf PATH** to be guaranteed to invoke the correct version of `getconf`).

19 Additional Recommendations

19.1 Recommendations for applications on ownership and permissions

19.1.1 Directory Write Permissions

The application should not depend on having directory write permission in any directory except `/tmp`, `/var/tmp`, and the invoking user's home directory.

In addition, the application may store variable data in `/var/opt/package`, (where *package* is the name of the application package), if such a directory is created with appropriate permissions during the package installation.

For these directories the application should be able to work with directory write permissions restricted by the `S_ISVTX` bit, implementing the restricted deletion mode as described for the XSI option for POSIX 1003.1-2008 (ISO/IEC 9945-2009).

19.1.2 File Write Permissions

The application should not depend on file write permission to any file that it does not itself create.

19.1.3 File Read and execute Permissions

The application should not depend on having read permission to every file and directory.

19.1.4 SUID and SGID Permissions

The application should not depend on the set user ID or set group ID (the `S_ISUID` or `S_ISGID` permission bits) permissions of a file not packaged with the application. Instead, the distribution is responsible for assuming that all system commands have the required permissions and work correctly.

Rationale: In order to implement common security policies it is strongly advisable for applications to use the minimum set of security attributes necessary for correct operation. Applications that require substantial appropriate privilege are likely to cause problems with such security policies.

19.1.5 Privileged users

In general, applications should not depend on running as a privileged user. This specification uses the term "appropriate privilege" throughout to identify operations that cannot be achieved without some special granting of additional privilege.

Applications that have a reason to run with appropriate privilege should outline this reason clearly in their documentation. Users of the application should be informed, that "this application demands security privileges, which could interfere with system security".

The application should not contain binary-only software that requires being run with appropriate privilege, as this makes security auditing harder or even impossible.

19.1.6 Changing permissions

The application shall not change permissions of files and directories that do not belong to its own package. Should an application require that certain files and directories not directly belonging to the package have a particular ownership, the application shall document this requirement, and may fail during installation if the permissions on these files is inappropriate.

19.1.7 Removable Media (Cdrom, Floppy, etc.)

Applications that expect to be runnable from removable media should not depend on logging in as a privileged user, and should be prepared to deal with a restrictive environment. Examples of such restrictions could be default mount options that disable set-user/group-ID attributes, disabling block or character-special files on the medium, or remapping the user and group IDs of files away from any privileged value.

Rationale: System vendors and local system administrators want to run applications from removable media, but want the possibility to control what the application can do.

19.1.8 Installable applications

Where the installation of an application needs additional privileges, it must clearly document all files and system databases that are modified outside of those in `/opt/pkg-name`, `/etc/opt/pkg-name`, and `/var/opt/pkg-name`, other than those that may be updated by system logging or auditing activities.

Without this, the local system administrator would have to blindly trust a piece of software, particularly with respect to its security.

20 Additional Behaviors

20.1 Mandatory Optional Behaviors

This section specifies behaviors in which there is optional behavior in one of the standards on which this specification relies, and where this specification requires a specific behavior.

Note: This specification does not require the kernel to be Linux; the set of mandated options reflects current existing practice, but may be modified in future releases.

LSB conforming implementations shall support the following options defined within the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*:

```
_POSIX_FSYNC
_POSIX_MAPPED_FILES
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MEMORY_PROTECTION
_POSIX_PRIORITY_SCHEDULING
_POSIX_REALTIME_SIGNALS
_POSIX_THREAD_ATTR_STACKADDR
_POSIX_THREAD_ATTR_STACKSIZE
_POSIX_THREAD_PROCESS_SHARED
_POSIX_THREAD_SAFE_FUNCTIONS
_POSIX_THREADS
```

The `opendir()` function shall consume a file descriptor in the same fashion as `open()`, and therefore may fail with `EMFILE` or `ENFILE`.

The `START` and `STOP` `termios` characters shall be changeable, as described as optional behavior in the "General Terminal Interface" section of the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*.

The `access()` function shall fail with `errno` set to `EINVAL` if the `amode` argument contains bits other than those set by the bitwise inclusive OR of `R_OK`, `W_OK`, `X_OK` and `F_OK`.

The `link()` function shall require access to the existing file in order to succeed, as described as optional behavior in the *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*.

Calling `unlink()` on a directory shall fail. Calling `link()` specifying a directory as the first argument shall fail. See also `unlink`.

Note: Linux allows `rename()` on a directory without having write access, but this specification does not require this behavior.

20.1.1 Special Requirements

LSB conforming systems shall enforce certain special additional restrictions above and beyond those required by *POSIX 1003.1-2008 (ISO/IEC 9945-2009)*.

Note: These additional restrictions are required in order to support the testing and certification programs associated with the LSB. In each case, these are values that defined macros must not have; conforming applications that use these values shall trigger a failure in the interface that is otherwise described as a "may fail".

The `fcntl()` function shall treat the "cmd" value -1 as invalid.

The *whence* value -1 shall be an invalid value for the `lseek()`, `fseek()` and `fcntl()` functions.

The value -5 shall be an invalid signal number.

If the `sigaddset()` or `sigdelset()` functions are passed an invalid signal number, they shall return with `EINVAL`. Implementations are only required to enforce this requirement for signal numbers which are specified to be invalid by this specification (such as the -5 mentioned above).

The mode value -1 to the `access()` function shall be treated as invalid.

A value of -1 shall be an invalid "_PC..." value for `pathconf()`.

A value of -1 shall be an invalid "_SC..." value for `sysconf()`.

The *nl_item* value -1 shall be invalid for `nl_langinfo()`.

The value -1 shall be an invalid "_CS..." value for `confstr()`.

The value "a" shall be an invalid *mode* argument to `popen()`.

The `fcntl()` function shall fail and set `errno` to `EDEADLK` if the *cmd* argument is `F_SETLKW`, and the lock is blocked by a lock from another process already blocked by the current process.

The `opendir()` function shall consume a file descriptor; the `readdir()` function shall fail and set `errno` to `EBADF` if the underlying file descriptor is closed.

The `link()` function shall not work across file systems, and shall fail and set `errno` to `EXDEV` as described as optional behavior in POSIX 1003.1-2008 (ISO/IEC 9945-2009).

20.2 Optional Mandatory Behaviors

This section specifies behaviors that are mandatory in one of the standards on which this specification relies, but which are optional in this specification.

POSIX 1003.1-2008 (ISO/IEC 9945-2009) describes the behavior of the file access time, available as the *st_atime* field of the `stat` and `stat64` structures. An LSB conforming implementation need not update this information every time a file is accessed.

Note: A subsequent edition of the POSIX standard no longer mandates updating of *st_atime* but the older edition is still the guiding standard for this specification, thus this exception is needed.

20.3 Executable Scripts

An executable script is an executable file of which the first two characters are `#!` as defined in the portable character set. In POSIX 1003.1-2008 (ISO/IEC 9945-2009), this construct is undefined, but reserved for implementations which wish to provide this functionality. LSB conforming implementations shall support executable scripts.

A successful call to a function of the `exec` family with an executable script as the first parameter shall result in a new process, where the process image started is that of the interpreter. The path name of the interpreter follows the `#!` characters.

If the executable script has a first line

```
#! interpreter [arg]
```

then *interpreter* shall be called with an argument array consisting of an unspecified zeroth argument, followed by *arg* (if present), followed by a path name for the script, followed by the arguments following the zeroth argument in the exec call of the script.

The interpreter shall not perform any operations on the first line of an executable script.

The first line of the executable script shall meet all of the following criteria otherwise the results are unspecified:

1. Is of one of the forms:

```
#!interpreter
#! interpreter
#!interpreter arg
#! interpreter arg
```

2. The *interpreter* argument is an absolute pathname of an executable file other than an executable script.
3. Neither the *interpreter* argument nor the *arg* argument, if present, contain any quoting characters.
4. Neither the *interpreter* argument nor the *arg* argument, if present, contain any whitespace characters.
5. The length of the entire line is no longer than 80 bytes.

If the interpreter is required by this specification to be in a specific named directory, a conforming application must use that path for *interpreter*, as implementations are not prohibited from having other, possibly non-conforming, versions of the same interpreter installed on the system. If the interpreter is a required command in this specification, but does not have a required path, the application should take special measures to insure the appropriate version is selected. If the interpreter is not a required command in this specification, the application must make appropriate provisions that the interpreter is available at the appropriate path.

Note: In case the path is not specified, it is recommended that an installation script for executable scripts use the standard PATH returned by a call to the **getconf** command with the argument *PATH*, combined with the **command** command to determine the location of a standard command.

For example to determine the location of the standard **awk** command:

```
PATH=`getconf PATH` command -v awk
```

The installation script should ensure that the returned pathname is an absolute pathname prior to use, since a shell builtin might be returned for some utilities.

Use of the common form `#!/usr/bin/env interpreter` is not recommended as the PATH will be unknown at execution time and an alternative version of *interpreter* might be selected.

21 Localization

21.1 Introduction

In order to install a message catalog, the installation procedure shall supply the message catalog in a format readable by the **msgfmt** command, which shall be invoked to compile the message catalog into an appropriate binary format on the target system.

Rationale: The original intent was to allow an application to contain the binary GNU MO format files. However, the format of these files is not officially stable, hence it is necessary to compile these catalogs on the target system. These binary catalogs may differ from architecture to architecture as well.

The resulting binary message catalog shall be located in the package's private area under `/opt`, and the application may use `bindtextdomain()` to specify this location.

Implementations shall support the POSIX and C locales as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009). Other locales may be supported.

Implementations may define additional locale categories not defined by that standard.

Note: Implementations choosing additional locale categories should be aware of ISO/IEC TR14652 and are advised not to choose names that conflict with that specification. If implementations provide locale categories whose names are part of the FDCC set of ISO/IEC TR14652, they should behave as defined by that specification.

21.2 Regular Expressions

Utilities that process regular expressions shall support Basic Regular Expressions and Extended Regular Expressions as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), with the following exceptions:

Range expression (such as `[a-z]`) can be based on code point order instead of collating element order.

Equivalence class expression (such as `[=a=]`) and multi-character collating element expression (such as `[.ch.]`) are optional.

Handling of a multi-character collating element is optional.

This affects at least the following utilities:

- **awk** (see `awk`)
- **grep** (see `grep`) (including **egrep**, see `egrep`)
- **sed** (see `sed`)

It also affects the behavior of interfaces in the base libraries, including at least

- `regexec()` (see `regexec`)

21.3 Pattern Matching Notation

Utilities that perform filename pattern matching (also known as Filename Globbing) shall do it as specified in POSIX 1003.1-2008 (ISO/IEC 9945-2009), Pattern Matching Notation, with the following exceptions:

Pattern bracket expressions (such as `[a-z]`) can be based on code point order instead of collating element order.

Equivalence class expression (such as `[=a=]`) and multi-character collating element expression (such as `[.ch.]`) are optional.

Handling of a multi-character collating element is optional.

This affects at least the following utilities: **cpio** (cpio), **find** and **tar** (tar).

VIII System Initialization

22 System Initialization

22.1 Cron Jobs

In addition to the individual user `crontab` files specified by POSIX 1003.1-2008 (ISO/IEC 9945-2009), which are located in `/var/spool/cron` as specified by the Filesystem Hierarchy Standard (FHS), the process that executes scheduled commands shall also process the following additional `crontab` files, which are in a different format (see below). `/etc/crontab`, `/etc/cron.d/*`. The installation of a package shall not modify the `crontab` file `/etc/crontab`, and shall not directly modify the user `crontab` files in `/var/spool/cron/crontabs`, but may use the **`crontab`** command to modify the latter.

If a package wishes to install a job that has to be executed periodically, it shall place an executable *cron script* in one of the following directories:

```
/etc/cron.hourly
/etc/cron.daily
/etc/cron.weekly
/etc/cron.monthly
```

As these directory names suggest, the files within them are executed on a hourly, daily, weekly, or monthly basis, respectively, under the control of an entry in one of the system `crontab` files, at an unspecified time of day. See below for the rules concerning the names of cron scripts.

Note: It is recommended that cron scripts installed in any of these directories be script files rather than compiled binaries so that they may be modified by the local system administrator. Conforming applications may only install cron scripts which use an interpreter required by this specification or provided by this or another conforming application.

This specification does not define the concept of a package *upgrade*. Implementations may do different things when packages are upgraded, including not replacing a cron script if it marked as a configuration file, particularly if the cron script appears to have been modified since installation. In some circumstances, the cron script may not be removed when the package is uninstalled. Applications should design their installation procedure and cron scripts to be robust in the face of such behavior. In particular, cron scripts should not fail obscurely if run in unexpected circumstances. Testing for the existence of application binaries before executing them is suggested.

If a certain task has to be executed at other than the predefined frequencies, the package shall install a file `/etc/cron.d/cron-name`. The file shall have the same format as that described for the **`crontab`** command in POSIX 1003.1-2008 (ISO/IEC 9945-2009), except that there shall be an additional field, *username*, before the name of the command to execute. For completeness, the seven fields shall be:

1. Minute [0,59]
2. Hour [0,23]
3. Day of the month [1,31]
4. Month of the year [1,12]
5. Day of the week [0,6] (with 0=Sunday)
6. Username
7. command [args ...]

This file shall be processed by the system automatically, with the named command being run at the specified time, as the specified username.

Applications installing files in these directories shall use the LSB naming conventions (see File Naming Conventions).

22.2 Init Script Actions

Conforming applications which need to execute commands on changes to the system run level (including boot and shutdown), may install one or more *init scripts*. Init scripts provided by conforming applications shall accept a single argument which selects the action:

start	start the service
stop	stop the service
restart	stop and restart the service if the service is already running, otherwise start the service
try-restart	restart the service if the service is already running
reload	cause the configuration of the service to be reloaded without actually stopping and restarting the service
force-reload	cause the configuration to be reloaded if the service supports this, otherwise restart the service if it is running
status	print the current status of the service

The **start**, **stop**, **restart**, **force-reload**, and **status** actions shall be supported by all init scripts; the **reload** and the **try-restart** actions are optional. Other init-script actions may be defined by the init script.

Init scripts shall ensure that they will behave sensibly if invoked with **start** when the service is already running, or with **stop** when not running, and that they do not kill similarly-named user processes. The best way to achieve this is to use the init-script functions provided by `/lib/lsb/init-functions` (see Init Script Functions)

If a service reloads its configuration automatically (as in the case of cron, for example), the **reload** action of the init script shall behave as if the configuration was reloaded successfully. The **restart**, **try-restart**, **reload** and **force-reload** actions may be atomic; that is if a service is known not to be operational after a restart or reload, the script may return an error without any further action.

Note: This specification does not define the concept of a package *upgrade*. Implementations may do different things when packages are upgraded, including not replacing an init script if it is marked as a configuration file, particularly if the file appears to have been modified since installation. In some circumstances, the init script may not be removed when the package is uninstalled. Applications should design their installation procedure and init scripts to be robust in the face of such behavior. In particular, init scripts should not fail obscurely if run in unexpected circumstances. Testing for the existence of application binaries before executing them is suggested.

If the **status** action is requested, the init script will return the following exit status codes.

0	program is running or service is OK
1	program is dead and /var/run pid file exists
2	program is dead and /var/lock lock file exists
3	program is not running
4	program or service status is unknown
5-99	reserved for future LSB use
100-149	reserved for distribution use
150-199	reserved for application use
200-254	reserved

For all other init-script actions, the init script shall return an exit status of zero if the action was successful. Otherwise, the exit status shall be non-zero, as defined below. In addition to straightforward success, the following situations are also to be considered successful:

- restarting a service (instead of reloading it) with the **force-reload** argument
- running **start** on a service already running
- running **stop** on a service already stopped or not running
- running **restart** on a service already stopped or not running
- running **try-restart** on a service already stopped or not running

In case of an error while processing any init-script action except for **status**, the init script shall print an error message and exit with a non-zero status code:

1	generic or unspecified error (current practice)
2	invalid or excess argument(s)
3	unimplemented feature (for example, "reload")
4	user had insufficient privilege
5	program is not installed
6	program is not configured
7	program is not running
8-99	reserved for future LSB use
100-149	reserved for distribution use
150-199	reserved for application use
200-254	reserved

Error and status messages should be printed with the logging functions (see Init Script Functions) `log_success_msg()`, `log_failure_msg()` and `log_warning_msg()`. Scripts may write to standard error or standard output, but implementations need not present text written to standard error/output to the user or do anything else with it.

Note: Since init scripts may be run manually by a system administrator with non-standard environment variable values for PATH, USER, LOGNAME, etc., init scripts should not depend on the values of these environment variables. They should set them to some known/default values if they are needed.

22.3 Comment Conventions for Init Scripts

Conforming applications may install one or more init scripts. These init scripts must be activated by invoking the **install_initd** command. Prior to package removal, the changes applied by **install_initd** must be undone by invoking **remove_initd**. See Installation and Removal of Init Scripts for more details.

install_initd and **remove_initd** determine actions to take by decoding a specially formatted block of lines in the script. This block shall be delimited by the lines

```
### BEGIN INIT INFO
### END INIT INFO
```

The delimiter lines may contain trailing whitespace, which shall be ignored. All lines inside the block shall begin with a hash character '#' in the first column, so the shell interprets them as comment lines which do not affect operation of the script. The lines shall be of the form:

```
# {keyword}: arg1 [arg2...]
```

with exactly one space character between the '#' and the keyword, with a single exception. In lines following a line containing the **Description** keyword, and until the next keyword or block ending delimiter is seen, a line where the '#' is followed by more than one space or a tab character shall be treated as a continuation of the previous line.

The information extracted from the block is used by the installation tool or the init-script system to assure that init scripts are run in the correct order. It is unspecified whether the information is evaluated only when **install_initd** runs, when the init scripts are executed, or both. The information extracted includes run levels, defined in Run Levels, and boot facilities, defined in Facility Names.

The following keywords, with their arguments, are defined:

Provides: boot_facility_1 [boot_facility_2...]

boot facilities provided by this init script. When an init script is run with a **start** argument, the boot facility or facilities specified by the **Provides** keyword shall be deemed present and hence init scripts which require those boot facilities should be started later. When an init script is run with a **stop** argument, the boot facilities specified by the **Provides** keyword are deemed no longer present.

Required-Start: boot_facility_1 [boot_facility_2...]

facilities which must be available during startup of this service. The init-script system should insure init scripts which provide the **Required-Start** facilities are started before starting this script.

Required-Stop: boot_facility_1 [boot_facility_2...]

facilities which must be available during the shutdown of this service. The init-script system should avoid stopping init scripts which provide the **Required-Stop** facilities until this script is stopped.

Should-Start: boot_facility_1 [boot_facility_2...]

facilities which, if present, should be available during startup of this service. This allows for weak dependencies which do not cause the service to fail if a facility is not available. The service may provide reduced functionality in this situation. Conforming applications should not rely on the existence of this feature.

Should-Stop: boot_facility_1 [boot_facility_2...]

facilities which should be available during shutdown of this service.

Default-Start: run_level_1 [run_level_2...]

Default-Stop: run_level_1 [run_level_2...]

which run levels should by default run the init script with a **start (stop)** argument to start (stop) the services controlled by the init script.

For example, if a service should run in runlevels 3, 4, and 5 only, specify "Default-Start: 3 4 5" and "Default-Stop: 0 1 2 6".

Short-Description: short_description

provide a brief description of the actions of the init script. Limited to a single line of text.

Description: multiline_description

provide a more complete description of the actions of the init script. May span multiple lines. In a multiline description, each continuation line shall begin with a '#' followed by tab character or a '#' followed by at least two space characters. The multiline description is terminated by the first line that does not match this criteria.

Additional keywords may be defined in future versions of this specification. Also, implementations may define local extensions by using the prefix **X-implementor**. For example, **X-RedHat-foobardecl**, or **X-Debian-xyzydecl**.

Example:

```
### BEGIN INIT INFO
# Provides: lsb-ourdb
# Required-Start: $local_fs $network $remote_fs
# Required-Stop: $local_fs $network $remote_fs
# Default-Start: 2 3 4 5
# Default-Stop: 0 1 6
# Short-Description: start and stop OurDB
# Description: OurDB is a very fast and reliable database
#               engine used for illustrating init scripts
### END INIT INFO
```

The comment conventions described in this section are only required for init scripts installed by conforming applications. Conforming runtime implementations are not required to use this scheme in their system provided init scripts.

Note: This specification does not require, but is designed to allow, the development of a system which runs init scripts in parallel. Hence, enforced-serialization of scripts is avoided unless it is explicitly necessary.

22.4 Installation and Removal of Init Scripts

Conforming applications may install one or more initialization scripts (or *init scripts*). An init script shall be installed in `/etc/init.d` (which may be a symbolic link to another location), by the package installer.

During the installer's post-install processing phase the program `/usr/lib/lsb/install_initd` must be called to activate the init script. Activation consists of arranging for the init script to be called in the correct order on system run-level changes (including system boot and shutdown), based on dependencies supplied in the init script (see Comment Conventions for Init Scripts). The **install_initd** command should be thought of as a wrapper which hides the implementation details; how any given implementation arranges for the init script to be called at the appropriate time is not specified.

Example: if an init script specified "Default-Start: 3 4 5" and "Default-Stop: 0 1 2 6", **install_initd** might create "start" symbolic links with names starting with 'S' in `/etc/rc3.d`, `/etc/rc4.d` and `/etc/rc5.d` and "stop" symbolic links with names starting with 'K' in `/etc/rc0.d`, `/etc/rc1.d`, `/etc/rc2.d` and `/etc/rc6.d`. Such a scheme would be similar to the System V Init mechanism, but is by no means the only way this specification could be implemented.

The **install_initd** command takes a single argument, the full pathname of the installed init script. The init script must already be installed in `/etc/init.d`. The **install_initd** command will not copy it there, only activate it once it has been installed. For example:

```
/usr/lib/lsb/install_initd /etc/init.d/example.com-coffee
```

The **install_initd** command shall return an exit status of zero if the init-script activation was successful or if the init script was already activated. If the dependencies in the init script (see Comment Conventions for Init Scripts) cannot be met, an exit status of one shall be returned and the init script shall not be activated.

When a software package is removed, `/usr/lib/lsb/remove_initd` must be called to deactivate the init script. This must occur before the init script itself is removed, as the dependency information in the script may be required for successful completion. Thus the installer's pre-remove processing phase must call **remove_initd**, and pass the full pathname of the installed init script. The package installer is still responsible for removing the init script. For example:

```
/usr/lib/lsb/remove_initd /etc/init.d/example.com-coffee
```

The **remove_initd** program shall return an exit status of zero if the init script has been successfully deactivated or if the init script is not activated. If another init script which depends on a boot facility provided by this init script is activated, an exit status of one shall be returned and the init script shall remain activated. The installer must fail on such an exit code so it does not subsequently remove the init script.

Note: This specification does not describe a mechanism for the system administrator to manipulate the run levels at which an init script is started or stopped. There is no assurance that modifying the comment block for this purpose will have the desired effect.

22.5 Run Levels

The following *run levels* are specified for use by the **Default-Start** and **Default-Stop** actions defined in Comment Conventions for Init Scripts as hints to the **install_initd** command. Conforming implementations are not required to provide these exact run levels or give them the meanings described here, and may map any level described here to a different level which provides the equivalent functionality. Applications may not depend on specific run-level numbers.

0	halt
1	single user mode
2	multiuser with no network services exported
3	normal/full multiuser
4	reserved for local use, default is normal/full multiuser
5	multiuser with a display manager or equivalent
6	reboot

Note: These run levels were chosen as reflecting the most frequent existing practice, and in the absence of other considerations, implementors are strongly encouraged to follow this convention to provide consistency for system administrators who need to work with multiple distributions.

22.6 Facility Names

Boot *facilities* are used to indicate dependencies in initialization scripts, as defined in Comment Conventions for Init Scripts. Facility names are assigned to scripts by the **Provides:** keyword. Facility names that begin with a dollar sign ('\$') are reserved system facility names.

Note: Facility names are only recognized in the context of the init script comment block and are not available in the body of the init script. In particular, the use of the leading '\$' character does not imply system facility names are subject to shell variable expansion, since they appear inside comments.

Conforming applications shall not provide facilities that begin with a dollar sign. Implementations shall provide the following facility names:

\$local_fs

all local file systems are mounted

\$network

basic networking support is available. Example: a server program could listen on a socket.

\$named

IP name-to-address translation, using the interfaces described in this specification, are available to the level the system normally provides them. Example: if a DNS query daemon normally provides this facility, then that daemon has been started.

\$portmap

daemons providing SunRPC/ONCRPC portmapping service as defined in RFC 1833: Binding Protocols for ONC RPC Version 2 (if present) are running.

\$remote_fs

all remote file systems are available. In some configurations, file systems such as `/usr` may be remote. Many applications that require **\$local_fs** will probably also require **\$remote_fs**.

\$syslog

system logger is operational.

\$time

the system time has been set, for example by using a network-based time program such as **ntp** or **rdate**, or via the hardware Real Time Clock.

Other (non-system) facilities may be defined by other conforming applications. These facilities shall be named using the same conventions defined for naming init scripts (see Script Names). Commonly, the facility provided by a conforming init script will have the same name as the name assigned to the init script.

22.7 Script Names

Since init scripts live in a single directory, they must share a single namespace. To avoid conflicts, applications installing files in this directories shall use the LSB naming conventions (see File Naming Conventions).

22.8 Init Script Functions

Each conforming init script shall execute the commands in the file `/lib/lsb/init-functions` in the current environment (see shell special built-in command **dot**). This file shall cause the following shell script commands to be defined in an unspecified manner.

Note: This can be done either by adding a directory to the `PATH` variable which defines these commands, or by defining shell aliases or functions.

Although the commands made available via this mechanism need not be conforming applications in their own right, applications that use them should only depend on features described in this specification.

Conforming scripts shall not specify the "exit on error" option (i.e. **set -e**) when sourcing this file, or calling any of the commands thus made available.

The **start_daemon**, **killproc** and **pidofproc** functions shall use the following algorithm for determining the status and the process identifiers of the specified program.

1. If the `-p pidfile` option is specified, and the named `pidfile` exists, a single line at the start of the `pidfile` shall be read. If this line contains one or more numeric values, separated by spaces, these values shall be used. If the `-p pidfile` option is specified and the named `pidfile` does not exist, the functions shall assume that the daemon is not running.

2. Otherwise, `/var/run/basename.pid` shall be read in a similar fashion. If this contains one or more numeric values on the first line, these values shall be used. Optionally, implementations may use unspecified additional methods to locate the process identifiers required.

The method used to determine the status is implementation defined, but should allow for non-binary programs.

Note: Commonly used methods check either for the existence of the `/proc/pid` directory or use `/proc/pid/exe` and `/proc/pid/cmdline`. Relying only on `/proc/pid/exe` is discouraged since this specification does not specify the existence of, or semantics for, `/proc`. Additionally, using `/proc/pid/exe` may result in a not-running status for daemons that are written in a script language.

Conforming implementations may use other mechanisms besides those based on pidfiles, unless the `-p pidfile` option has been used. Conforming applications should not rely on such mechanisms and should always use a pidfile. When a program is stopped, it should delete its pidfile. Multiple process identifiers shall be separated by a single space in the pidfile and in the output of **pidofproc**.

start_daemon [-f] [-n nicelevel] [-p pidfile] pathname [args...]

runs the specified program as a daemon. The **start_daemon** function shall check if the program is already running using the algorithm given above. If so, it shall not start another copy of the daemon unless the `-f` option is given. The `-n` option specifies a nice level. See **nice**. **start_daemon** shall return the LSB defined exit status codes. It shall return 0 if the program has been successfully started or is running and not 0 otherwise.

killproc [-p pidfile] pathname [signal]

The **killproc** function shall stop the specified program. The program is found using the algorithm given above. If a signal is specified, using the `-signal_name` or `-signal_number` syntaxes as specified by the **kill** command, the program is sent that signal. Otherwise, a `SIGTERM` followed by a `SIGKILL` after an unspecified number of seconds shall be sent. If a program has been terminated, the pidfile should be removed if the terminated process has not already done so. The **killproc** function shall return the LSB defined exit status codes. If called without a signal, it shall return 0 if the program has been stopped or is not running and not 0 otherwise. If a signal is given, it shall return 0 only if the program is running.

pidofproc [-p pidfile] pathname

The **pidofproc** function shall return one or more process identifiers for a particular daemon using the algorithm given above. Only process identifiers of running processes should be returned. Multiple process identifiers shall be separated by a single space.

Note: A process may exit between **pidofproc** discovering its identity and the caller of **pidofproc** being able to act on that identity. As a result, no test assertion can be made that the process identifiers returned by **pidofproc** shall be running processes.

The **pidofproc** function shall return the LSB defined exit status codes for "status". It shall return 0 if the program is running and not 0 otherwise.

log_success_msg message

The **log_success_msg** function shall cause the system to write a success message to an unspecified log file. The format of the message is unspecified. The **log_success_msg** function may also write a message to the standard output.

Note: The message should be relatively short; no more than 60 characters is highly desirable.

log_failure_msg message

The **log_failure_msg** function shall cause the system to write a failure message to an unspecified log file. The format of the message is unspecified. The **log_failure_msg** function may also write a message to the standard output.

Note: The message should be relatively short; no more than 60 characters is highly desirable.

log_warning_msg message

The **log_warning_msg** function shall cause the system to write a warning message to an unspecified log file. The format of the message is unspecified. The **log_warning_msg** function may also write a message to the standard output.

Note: The message should be relatively short; no more than 60 characters is highly desirable.

IX Users & Groups

23 Users & Groups

23.1 User and Group Database

The format of the User and Group databases is not specified. Programs may only read these databases using the provided API. Changes to these databases should be made using the provided commands.

23.2 User & Group Names

Table 23-1 describes required mnemonic user and group names. This specification makes no attempt to numerically assign user or group identity numbers, with the exception that both the User ID and Group ID for the user `root` shall be equal to 0.

Table 23-1 Required User & Group Names

User	Group	Comments
root	root	Administrative user with all appropriate privileges
bin	bin	Legacy User ID/Group ID ^a
daemon	daemon	Legacy User ID/Group ID ^b
Notes: a The <code>bin</code> User ID/Group ID is included for compatibility with legacy applications. New applications should no longer use the <code>bin</code> User ID/Group ID. b The <code>daemon</code> User ID/Group ID was used as an unprivileged User ID/Group ID for daemons to execute under in order to limit their access to the system. Generally daemons should now run under individual User ID/Group IDs in order to further partition daemons from one another.		

Table 23-2 is a table of optional mnemonic user and group names. This specification makes no attempt to numerically assign uid or gid numbers. If the username exists on a system, then they should be in the suggested corresponding group. These user and group names are for use by distributions, not by applications.

Table 23-2 Optional User & Group Names

User	Group	Comments
adm	adm	Administrative special privileges
lp	lp	Printer special privileges
sync	sync	Login to sync the system

User	Group	Comments
shutdown	shutdown	Login to shutdown the system
halt	halt	Login to halt the system
mail	mail	Mail special privileges
news	news	News special privileges
uucp	Uucp	UUCP special privileges
operator	Root	Operator special privileges
man	Man	Man special privileges
nobody	Nobody	Used by NFS

Only a minimum working set of "user names" and their corresponding "user groups" are required. Applications cannot assume non system user or group names will be defined.

Applications cannot assume any policy for the default file creation mask (**umask**) or the default directory permissions a user may have. Applications should enforce user only file permissions on private files such as mailboxes. The location of the users home directory is also not defined by policy other than the recommendations of the Filesystem Hierarchy Standard and should be obtained by the `getpwnam()`, `getpwnam_r()`, `getpwent()`, `getpwuid()`, and `getpwuid_r()` functions.

23.3 User ID Ranges

The system User IDs from 0 to 99 should be statically allocated by the system, and shall not be created by applications.

The system User IDs from 100 to 499 should be reserved for dynamic allocation by system administrators and post install scripts using **useradd**.

23.4 Rationale

The purpose of specifying optional users and groups is to reduce the potential for name conflicts between applications and distributions.

X Network Security Services

24 Libraries

24.1 Interfaces for libnspr4

Table 24-1 defines the library name and shared object name for the libnspr4 library

Table 24-1 libnspr4 Definition

Library:	libnspr4
SONAME:	libnspr4.so

The behavior of the interfaces in this library is specified by the following specifications:

[NSPR] NSPR Reference

24.1.1 Netscape Portable Runtime

24.1.1.1 Interfaces for Netscape Portable Runtime

An LSB conforming implementation shall provide the generic functions for Netscape Portable Runtime specified in Table 24-2, with the full mandatory functionality as described in the referenced underlying specification.

24.2 Data Definitions for libnspr4

This section defines global identifiers and their values that are associated with interfaces contained in libnspr4. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

24.3 Interfaces for libnss3

Table 24-3 defines the library name and shared object name for the libnss3 library

Table 24-3 libnss3 Definition

Library:	libnss3
SONAME:	libnss3.so

The behavior of the interfaces in this library is specified by the following specifications:

[NSS SSL] Mozilla's NSS SSL Reference

24.3.1 NSS Utility

24.3.1.1 Interfaces for NSS Utility

An LSB conforming implementation shall provide the generic functions for NSS Utility specified in Table 24-4, with the full mandatory functionality as described in the referenced underlying specification.

Table 24-4 libnss3 - NSS Utility Function Interfaces

CERT_CheckCertValidTimes(NSS_3.2) [NSS SSL]	CERT_DestroyCertificate(NSS_3.2) [NSS SSL]	CERT_DupCertificate(NSS_3.2) [NSS SSL]
CERT_FreeNicknames(NSS_3.2) [NSS SSL]	CERT_GetCertNicknames(NSS_3.2) [NSS SSL]	CERT_GetDefaultCertDB(NSS_3.2) [NSS SSL]
CERT_VerifyCertName(NSS_3.2) [NSS SSL]	CERT_VerifyCertNow(NSS_3.2) [NSS SSL]	NSS_Init(NSS_3.2) [NSS SSL]

------------------------------------	--	---

24.4 Data Definitions for libnss3

This section defines global identifiers and their values that are associated with interfaces contained in libnss3. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

24.5 Interfaces for libssl3

Table 24-5 defines the library name and shared object name for the libssl3 library

Table 24-5 libssl3 Definition

Library:	libssl3
SONAME:	libssl3.so

The behavior of the interfaces in this library is specified by the following specifications:

[NSS SSL] Mozilla's NSS SSL Reference

24.5.1 NSS SSL

24.5.1.1 Interfaces for NSS SSL

An LSB conforming implementation shall provide the generic functions for NSS SSL specified in Table 24-6, with the full mandatory functionality as described in the referenced underlying specification.

Table 24-6 libssl3 - NSS SSL Function Interfaces

NSS_CmpCertChainW CANames(NSS_3.2) [NSS SSL]	NSS_FindCertKEAType (NSS_3.2) [NSS SSL]	NSS_GetClientAuthDat a(NSS_3.2) [NSS SSL]

24.6 Data Definitions for libssl3

This section defines global identifiers and their values that are associated with interfaces contained in libssl3. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

XI Package Format and Installation

25 Software Installation

25.1 Introduction

Applications shall either be packaged in the RPM packaging format as defined in this specification, or supply an installer which is LSB conforming (for example, calls LSB commands and utilities).

Note: Supplying an RPM format package is encouraged because it makes systems easier to manage. This specification does not require the implementation to use RPM as the package manager; it only specifies the format of the package file and requires that implementations must have some method of installing conforming packages.

Applications are also encouraged to uninstall cleanly.

A package in the RPM format may include a dependency on the LSB Core and other LSB specifications, as described in Section 25.6. Packages that are not in the RPM format may test for the presence of a conforming implementation by means of the `lsb_release` utility.

Implementations shall provide a mechanism for installing applications in the RPM packaging format with some restrictions listed below.

Note: The implementation itself may use a different packaging format for its own packages, and may use any available mechanism for installing conforming packages, including translation into a different format.

25.2 Package File Format

An RPM format file consists of 4 sections, the Lead, Signature, Header, and the Payload. All values are stored in network byte order.

Table 25-1 RPM File Format

Lead
Signature
Header
Payload

These 4 sections shall exist in the order specified.

The lead section is used to identify the package file.

The signature section is used to verify the integrity, and optionally, the authenticity of the majority of the package file.

The header section contains all available information about the package. Entries such as the package's name, version, and file list, are contained in the header.

The payload section holds the files to be installed.

25.2.1 Lead Section

```
struct rpmlead {
    unsigned char magic[4];
    unsigned char major, minor;
    short type;
```

```

    short archnum;
    char name[66];
    short osnum;
    short signature_type;
    char reserved[16];
} ;

```

magic

Value identifying this file as an RPM format file. This value shall be "\355\253\356\333".

major

Value indicating the major version number of the file format version. This value shall be 3.

minor

Value indicating the minor revision number of file format version. This value shall be 0.

type

Value indicating whether this is a source or binary package. This value shall be 0 to indicate a binary package.

archnum

Value indicating the architecture for which this package is valid. This value is specified in the relevant architecture specific part of the LSB Core Specification.

name

A NUL terminated string that provides the package name. This name shall conform with the Package Naming Conventions section of this specification.

osnum

Value indicating the Operating System for which this package is valid. This value shall be 1.

signature_type

Value indicating the type of the signature used in the Signature part of the file. This value shall be 5.

reserved

Reserved space. The value is undefined.

25.2.2 Header Structure

The Header structure is used for both the Signature and Header Sections. A Header Structure consists of 3 parts, a Header record, followed by 1 or more Index records, followed by 0 or more bytes of data associated with the Index records. A Header structure shall be aligned to an 8 byte boundary.

Table 25-2 Signature Format

Header Record

Array of Index Records
Store of Index Values

25.2.2.1 Header Record

```
struct rpmheader {
    unsigned char magic[4];
    unsigned char reserved[4];
    int nindex;
    int hsize;
};
```

magic

Value identifying this record as an RPM header record. This value shall be "\216\255\350\001".

reserved

Reserved space. This value shall be "\000\000\000\000".

nindex

The number of Index Records that follow this Header Record. There should be at least 1 Index Record.

hsize

The size in bytes of the storage area for the data pointed to by the Index Records.

25.2.2.2 Index Record

```
struct rpmhdrindex {
    int tag;
    int type;
    int offset;
    int count;
};
```

tag

Value identifying the purpose of the data associated with this Index Record. The value of this field is dependent on the context in which the Index Record is used, and is defined below and in later sections.

type

Value identifying the type of the data associated with this Index Record. The possible *type* values are defined below.

offset

Location in the Store of the data associated with this Index Record. This value should be between 0 and the value contained in the *hsize* of the Header Structure.

count

Size of the data associated with this Index Record. The *count* is the number of elements whose size is defined by the type of this Record.

25.2.2.2.1 Index Type Values

The possible values for the *type* field are defined in this table.

Table 25-3 Index Type values

Type	Value	Size (in bytes)	Alignment
RPM_NULL_TYPE	0	Not Implemented.	
RPM_CHAR_TYPE	1	1	1
RPM_INT8_TYPE	2	1	1
RPM_INT16_TYPE	3	2	2
RPM_INT32_TYPE	4	4	4
RPM_INT64_TYPE	5	Reserved.	
RPM_STRING_TYPE	6	variable, NUL terminated	1
RPM_BIN_TYPE	7	1	1
RPM_STRING_ARRAY_TYPE	8	Variable, sequence of NUL terminated strings	1
RPM_I18NSTRING_TYPE	9	variable, sequence of NUL terminated strings	1

The string arrays specified for entries of type `RPM_STRING_ARRAY_TYPE` and `RPM_I18NSTRING_TYPE` are vectors of strings in a contiguous block of memory, each element separated from its neighbors by a NUL character.

Index records with type `RPM_I18NSTRING_TYPE` shall always have a *count* of 1. The array entries in an index of type `RPM_I18NSTRING_TYPE` correspond to the locale names contained in the `RPMTAG_HDRI18N` index.

25.2.2.2.2 Index Tag Values

Some values are designated as header private, and may appear in any header structure. These are defined here. Additional values are defined in later sections.

Table 25-4 Header Private Tag Values

Name	Tag Value	Type	Count	Status
RPMTAG_HEADERSIGNATURES	62	BIN	16	Optional
RPMTAG_HEADERIMMUTABLE	63	BIN	16	Optional

Name	Tag Value	Type	Count	Status
RPMTAG_HEAD ERI18NTABLE	100	STRING_ARRA Y		Optional

RPMTAG_HEADERSIGNATURES

The signature tag differentiates a signature header from a metadata header, and identifies the original contents of the signature header.

RPMTAG_HEADERIMMUTABLE

This tag contains an index record which specifies the portion of the Header Record which was used for the calculation of a signature. This data shall be preserved or any header-only signature will be invalidated.

RPMTAG_HEADERI18NTABLE

Contains a list of locales for which strings are provided in other parts of the package.

Not all Index records defined here will be present in all packages. Each tag value has a status which is defined here.

Required

This Index Record shall be present.

Optional

This Index Record may be present.

Informational

This Index Record may be present, but does not contribute to the processing of the package.

Deprecated

This Index Record should not be present.

Obsolete

This Index Record shall not be present.

Reserved

This Index Record shall not be present.

25.2.2.3 Header Store

The header store contains the values specified by the Index structures. These values are aligned according to their type and padding is used if needed. The store is located immediately following the Index structures.

25.2.3 Signature Section

The Signature section is implemented using the Header structure. The signature section defines the following additional tag values which may be used in the Index structures.

These values exist to provide additional information about the rest of the package.

Table 25-5 Signature Tag Values

Name	Tag Value	Type	Count	Status
RPMSIGTAG_SIZE	1000	INT32	1	Required
RPMSIGTAG_PAYLOADSIZE	1007	INT32	1	Optional

RPMSIGTAG_SIZE

This tag specifies the combined size of the Header and Payload sections.

RPMSIGTAG_PAYLOADSIZE

This tag specifies the uncompressed size of the Payload archive, including the cpio headers.

These values exist to ensure the integrity of the rest of the package.

Table 25-6 Signature Digest Tag Values

Name	Tag Value	Type	Count	Status
RPMSIGTAG_SHA1	269	STRING	1	Optional
RPMSIGTAG_MD5	1004	BIN	16	Required

RPMSIGTAG_SHA1

This index contains the SHA1 checksum of the entire Header Section, including the Header Record, Index Records and Header store.

RPMSIGTAG_MD5

This tag specifies the 128-bit MD5 checksum of the combined Header and Archive sections.

These values exist to provide authentication of the package.

Table 25-7 Signature Signing Tag Values

Name	Tag Value	Type	Count	Status
RPMSIGTAG_DSA	267	BIN	65	Optional
RPMSIGTAG_RSA	268	BIN	1	Optional
RPMSIGTAG_PG	1002	BIN	1	Optional
RPMSIGTAG_GPG	1005	BIN	65	Optional

RPMSIGTAG_DSA

The tag contains the DSA signature of the Header section. The data is formatted as a Version 3 Signature Packet as specified in RFC 2440:

OpenPGP Message Format. If this tag is present, then the SIGTAG_GPG tag shall also be present.

RPMSIGTAG_RSA

The tag contains the RSA signature of the Header section. The data is formatted as a Version 3 Signature Packet as specified in RFC 2440: OpenPGP Message Format. If this tag is present, then the SIGTAG_PGP shall also be present.

RPMSIGTAG_PGP

This tag specifies the RSA signature of the combined Header and Payload sections. The data is formatted as a Version 3 Signature Packet as specified in RFC 2440: OpenPGP Message Format.

RPMSIGTAG_GPG

The tag contains the DSA signature of the combined Header and Payload sections. The data is formatted as a Version 3 Signature Packet as specified in RFC 2440: OpenPGP Message Format.

25.2.4 Header Section

The Header section is implemented using the Header structure. The Header section defines the following additional tag values which may be used in the Index structures.

25.2.4.1 Package Information

The following tag values are used to indicate information that describes the package as a whole.

Table 25-8 Package Info Tag Values

Name	Tag Value	Type	Count	Status
RPMTAG_NAME	1000	STRING	1	Required
RPMTAG_VERSION	1001	STRING	1	Required
RPMTAG_RELEASE	1002	STRING	1	Required
RPMTAG_SUMMARY	1004	I18NSTRING	1	Required
RPMTAG_DESCRIPTION	1005	I18NSTRING	1	Required
RPMTAG_SIZE	1009	INT32	1	Required
RPMTAG_DISTRIBUTION	1010	STRING	1	Informational
RPMTAG_VENDOR	1011	STRING	1	Informational
RPMTAG_LICENSE	1014	STRING	1	Required

Name	Tag Value	Type	Count	Status
RPMTAG_PACK AGER	1015	STRING	1	Informationa l
RPMTAG_GROU P	1016	I18NSTRING	1	Required
RPMTAG_URL	1020	STRING	1	Informationa l
RPMTAG_OS	1021	STRING	1	Required
RPMTAG_ARCH	1022	STRING	1	Required
RPMTAG_SOUR CERPM	1044	STRING	1	Informationa l
RPMTAG_ARCH IVESIZE	1046	INT32	1	Optional
RPMTAG_RPMV ERSION	1064	STRING	1	Informationa l
RPMTAG_COOK IE	1094	STRING	1	Optional
RPMTAG_DIST URL	1123	STRING	1	Informationa l
RPMTAG_PAYL OADFORMAT	1124	STRING	1	Required
RPMTAG_PAYL OADCOMPRESS OR	1125	STRING	1	Required
RPMTAG_PAYL OADFLAGS	1126	STRING	1	Required

RPMTAG_NAME

This tag specifies the name of the package.

RPMTAG_VERSION

This tag specifies the version of the package.

RPMTAG_RELEASE

This tag specifies the release of the package.

RPMTAG_SUMMARY

This tag specifies the summary description of the package. The summary value pointed to by this index record contains a one line description of the package.

RPMTAG_DESCRIPTION

This tag specifies the description of the package. The description value pointed to by this index record contains a full description of the package.

RPMTAG_SIZE

This tag specifies the sum of the sizes of the regular files in the archive.

RPMTAG_DISTRIBUTION

A string containing the name of the distribution on which the package was built.

RPMTAG_VENDOR

A string containing the name of the organization that produced the package.

RPMTAG_LICENSE

This tag specifies the license which applies to this package.

RPMTAG_PACKAGER

A string identifying the tool used to build the package.

RPMTAG_GROUP

This tag specifies the administrative group to which this package belongs.

RPMTAG_URL

Generic package information URL.

RPMTAG_OS

This tag specifies the OS of the package. The OS value pointed to by this index record shall be "linux".

RPMTAG_ARCH

This tag specifies the architecture of the package. The architecture value pointed to by this index record is defined in architecture specific LSB specification.

RPMTAG_SOURCERPM

This tag specifies the name of the source RPM.

RPMTAG_ARCHIVESIZE

This tag specifies the uncompressed size of the Payload archive, including the cpio headers.

RPMTAG_RPMVERSION

This tag indicates the version of RPM tool used to build this package. The value is unused.

RPMTAG_COOKIE

This tag contains an opaque string whose contents are undefined.

RPMTAG_DISTURL

URL for package.

RPMTAG_PAYLOADFORMAT

This tag specifies the format of the Archive section. The format value pointed to by this index record shall be 'cpio'.

RPMTAG_PAYLOADCOMPRESSOR

This tag specifies the compression used on the Archive section. The compression value pointed to by this index record shall be 'gzip'.

RPMTAG_PAYLOADFLAGS

This tag indicates the compression level used for the Payload. This value shall always be '9'.

25.2.4.2 Installation Information

The following tag values are used to provide information needed during the installation of the package.

Table 25-9 Installation Tag Values

Name	Tag Value	Type	Count	Status
RPMTAG_PREIN	1023	STRING	1	Optional
RPMTAG_POSTIN	1024	STRING	1	Optional
RPMTAG_PREUN	1025	STRING	1	Optional
RPMTAG_POSTUN	1026	STRING	1	Optional
RPMTAG_PREINPROG	1085	STRING	1	Optional
RPMTAG_POSTINPROG	1086	STRING	1	Optional
RPMTAG_PREUNPROG	1087	STRING	1	Optional
RPMTAG_POSTUNPROG	1088	STRING	1	Optional

RPMTAG_PREIN

This tag specifies the preinstall scriptlet. If present, then RPMTAG_PREINPROG shall also be present.

RPMTAG_POSTIN

This tag specifies the postinstall scriptlet. If present, then RPMTAG_POSTINPROG shall also be present.

RPMTAG_PREUN

This tag specifies the preuninstall scriptlet. If present, then RPMTAG_PREUNPROG shall also be present.

RPMTAG_POSTUN

This tag specifies the postuninstall scriptlet. If present, then RPMTAG_POSTUNPROG shall also be present.

RPMTAG_PREINPROG

This tag specifies the name of the interpreter to which the preinstall scriptlet will be passed. The interpreter pointed to by this index record shall be /bin/sh.

RPMTAG_POSTINPROG

This tag specifies the name of the interpreter to which the postinstall scriptlet will be passed. The interpreter pointed to by this index record shall be /bin/sh.

RPMTAG_PREUNPROG

This tag specifies the name of the interpreter to which the preuninstall scriptlet will be passed. The interpreter pointed to by this index record shall be /bin/sh.

RPMTAG_POSTUNPROG

This program specifies the name of the interpreter to which the postuninstall scriptlet will be passed. The interpreter pointed to by this index record shall be /bin/sh.

25.2.4.3 File Information

The following tag values are used to provide information about the files in the payload. This information is provided in the header to allow more efficient access of the information.

Table 25-10 File Info Tag Values

Name	Tag Value	Type	Count	Status
RPMTAG_OLDFILENAMES	1027	STRING_ARRAY		Optional
RPMTAG_FILESIZES	1028	INT32		Required
RPMTAG_FILEMODES	1030	INT16		Required
RPMTAG_FILERDEVS	1033	INT16		Required
RPMTAG_FILEMTIMES	1034	INT32		Required
RPMTAG_FILEMD5S	1035	STRING_ARRAY		Required
RPMTAG_FILELINKTOS	1036	STRING_ARRAY		Required
RPMTAG_FILEFLAGS	1037	INT32		Required
RPMTAG_FILEUSERNAME	1039	STRING_ARRAY		Required
RPMTAG_FILEGROUPNAME	1040	STRING_ARRAY		Required

Name	Tag Value	Type	Count	Status
RPMTAG_FILE DEVICES	1095	INT32		Required
RPMTAG_FILE INODES	1096	INT32		Required
RPMTAG_FILE LANGS	1097	STRING_ARRA Y		Required
RPMTAG_DIRI NDEXES	1116	INT32		Optional
RPMTAG_BASE NAMES	1117	STRING_ARRA Y		Optional
RPMTAG_DIRN AMES	1118	STRING_ARRA Y		Optional

RPMTAG_OLDFILENAMES

This tag specifies the filenames when not in a compressed format as determined by the absence of `rpmLib(CompressedFileNames)` in the `RPMTAG_REQUIRENAME` index.

RPMTAG_FILESIZES

This tag specifies the size of each file in the archive.

RPMTAG_FILEMODES

This tag specifies the mode of each file in the archive.

RPMTAG_FILERDEVS

This tag specifies the device number from which the file was copied.

RPMTAG_FILEMTIMES

This tag specifies the modification time in seconds since the epoch of each file in the archive.

RPMTAG_FILEMD5S

This tag specifies the ASCII representation of the MD5 sum of the corresponding file contents. This value is empty if the corresponding archive entry is not a regular file.

RPMTAG_FILELINKTOS

The target for a symlink, otherwise NULL.

RPMTAG_FILEFLAGS

This tag specifies the bit(s) to classify and control how files are to be installed. See below.

RPMTAG_FILEUSERNAME

This tag specifies the owner of the corresponding file.

RPMTAG_FILEGROUPNAME

This tag specifies the group of the corresponding file.

RPMTAG_FILEDEVICES

This tag specifies the 16 bit device number from which the file was copied.

RPMTAG_FILEINODES

This tag specifies the inode value from the original file system on the the system on which it was built.

RPMTAG_FILELANGS

This tag specifies a per-file locale marker used to install only locale specific subsets of files when the package is installed.

RPMTAG_DIRINDEXES

This tag specifies the index into the array provided by the **RPMTAG_DIRNAMES** Index which contains the directory name for the corresponding filename.

RPMTAG_BASENAMES

This tag specifies the base portion of the corresponding filename.

RPMTAG_DIRNAMES

One of **RPMTAG_OLDFILENAMES** or the tuple **RPMTAG_DIRINDEXES**, **RPMTAG_BASENAMES**, **RPMTAG_DIRNAMES** shall be present, but not both.

25.2.4.3.1 File Flags

The **RPMTAG_FILEFLAGS** tag value shall identify various characteristics of the file in the payload that it describes. It shall be an INT32 value consisting of either the value **RPMFILE_NONE** (0) or the bitwise inclusive or of one or more of the following values:

Table 25-11 File Flags

Name	Value
RPMFILE_CONFIG	(1 << 0)
RPMFILE_DOC	(1 << 1)
RPMFILE_DONOTUSE	(1 << 2)
RPMFILE_MISSINGOK	(1 << 3)
RPMFILE_NOREPLACE	(1 << 4)
RPMFILE_SPECFILE	(1 << 5)
RPMFILE_GHOST	(1 << 6)
RPMFILE_LICENSE	(1 << 7)
RPMFILE_README	(1 << 8)
RPMFILE_EXCLUDE	(1 << 9)

These bits have the following meaning:

`RPMFILE_CONFIG`

The file is a configuration file, and an existing file should be saved during a package upgrade operation and not removed during a package removal operation.

`RPMFILE_DOC`

The file contains documentation.

`RPMFILE_DONOTUSE`

This value is reserved for future use; conforming packages may not use this flag.

`RPMFILE_MISSINGOK`

The file need not exist on the installed system.

`RPMFILE_NOREPLACE`

Similar to the `RPMFILE_CONFIG`, this flag indicates that during an upgrade operation the original file on the system should not be altered.

`RPMFILE_SPECFILE`

The file is a package specification.

`RPMFILE_GHOST`

The file is not actually included in the payload, but should still be considered as a part of the package. For example, a log file generated by the application at run time.

`RPMFILE_LICENSE`

The file contains the license conditions.

`RPMFILE_README`

The file contains high level notes about the package.

`RPMFILE_EXCLUDE`

The corresponding file is not a part of the package, and should not be installed.

25.2.4.4 Dependency Information

The following tag values are used to provide information about interdependencies between packages.

Table 25-12 Package Dependency Tag Values

Name	Tag Value	Type	Count	Status
<code>RPMTAG_PROVIDENAME</code>	1047	STRING_ARRAY	1	Required
<code>RPMTAG_REQUIREFLAGS</code>	1048	INT32		Required

Name	Tag Value	Type	Count	Status
RPMTAG_REQUIRENAME	1049	STRING_ARRAY		Required
RPMTAG_REQUIREVERSION	1050	STRING_ARRAY		Required
RPMTAG_CONFLICTFLAGS	1053	INT32		Optional
RPMTAG_CONFLICTNAME	1054	STRING_ARRAY		Optional
RPMTAG_CONFLICTVERSION	1055	STRING_ARRAY		Optional
RPMTAG_OBSOLETE_NAME	1090	STRING_ARRAY		Optional
RPMTAG_PROVIDEFLAGS	1112	INT32		Required
RPMTAG_PROVIDEVERSION	1113	STRING_ARRAY		Required
RPMTAG_OBSOLETE_FLAGS	1114	INT32	1	Optional
RPMTAG_OBSOLETEVERSION	1115	STRING_ARRAY		Optional

RPMTAG_PROVIDENAME

This tag indicates the name of the dependency provided by this package.

RPMTAG_REQUIREFLAGS

Bits(s) to specify the dependency range and context.

RPMTAG_REQUIRENAME

This tag indicates the dependencies for this package.

RPMTAG_REQUIREVERSION

This tag indicates the versions associated with the values found in the RPMTAG_REQUIRENAME Index.

RPMTAG_CONFLICTFLAGS

Bits(s) to specify the conflict range and context.

RPMTAG_CONFLICTNAME

This tag indicates the conflicting dependencies for this package.

RPMTAG_CONFLICTVERSION

This tag indicates the versions associated with the values found in the RPMTAG_CONFLICTNAME Index.

RPMTAG_OBSOLETE_NAME

This tag indicates the obsoleted dependencies for this package.

RPMTAG_PROVIDEFLAGS

Bits(s) to specify the conflict range and context.

RPMTAG_PROVIDEVERSION

This tag indicates the versions associated with the values found in the RPMTAG_PROVIDENAME Index.

RPMTAG_OBSOLETEFLAGS

Bits(s) to specify the conflict range and context.

RPMTAG_OBSOLETEVERSION

This tag indicates the versions associated with the values found in the RPMTAG_OBSOLETEINDEX Index.

25.2.4.4.1 Package Dependency Values

The package dependencies are stored in the RPMTAG_REQUIRENAME and RPMTAG_REQUIREVERSION index records. The following values may be used.

Table 25-13 Index Type values

Name	Version	Meaning	Status
rpmlib(VersionedDependencies)	3.0.3-1	Indicates that the package contains RPMTAG_PROVIDENAME, RPMTAG_OBSOLETEINDEX or RPMTAG_PREREQ records that have a version associated with them.	Optional
rpmlib(PayloadFilesHavePrefix)	4.0-1	Indicates the filenames in the Archive have had "." prepended to them.	Optional
rpmlib(CompressedFileNames)	3.0.4-1	Indicates that the filenames in the Payload are represented in the RPMTAG_DIRINDEXES, RPMTAG_DIRNAME and RPMTAG_BASENAMES indexes.	Optional

Name	Version	Meaning	Status
/bin/sh		Interpreter usually required for installation scripts.	Optional

Additional dependencies are specified in the Package Dependencies section of this specification, and in the relevant architecture specific part of the LSB Core Specification.

25.2.4.4.2 Package Dependencies Attributes

The package dependency attributes are stored in the `RPMTAG_REQUIREFLAGS`, `RPMTAG_PROVIDEFLAGS` and `RPMTAG_OBSOLETEFLAGS` index records. The following values may be used.

Table 25-14 Package Dependency Attributes

Name	Value	Meaning
<code>RPMSSENSE_LESS</code>	<code>0x02</code>	
<code>RPMSSENSE_GREATER</code>	<code>0x04</code>	
<code>RPMSSENSE_EQUAL</code>	<code>0x08</code>	
<code>RPMSSENSE_PREREQ</code>	<code>0x40</code>	
<code>RPMSSENSE_INTERP</code>	<code>0x100</code>	
<code>RPMSSENSE_SCRIPT_PRE</code>	<code>0x200</code>	
<code>RPMSSENSE_SCRIPT_POST</code>	<code>0x400</code>	
<code>RPMSSENSE_SCRIPT_PREUN</code>	<code>0x800</code>	
<code>RPMSSENSE_SCRIPT_POSTUN</code>	<code>0x1000</code>	
<code>RPMSSENSE_RPMLIB</code>	<code>0x1000000</code>	

25.2.4.5 Other Information

The following tag values are also found in the Header section.

Table 25-15 Other Tag Values

Name	Tag Value	Type	Count	Status
<code>RPMTAG_BUILDTIME</code>	1006	INT32	1	Informational
<code>RPMTAG_BUILDHOST</code>	1007	STRING	1	Informational
<code>RPMTAG_FILEVERIFYFLAGS</code>	1045	INT32		Optional
<code>RPMTAG_CHANGELOGTIME</code>	1080	INT32		Optional

Name	Tag Value	Type	Count	Status
RPMTAG_CHAN GELOGNAME	1081	STRING_ARRAY		Optional
RPMTAG_CHAN GELOGTEXT	1082	STRING_ARRAY		Optional
RPMTAG_OPTFL AGS	1122	STRING	1	Informational
RPMTAG_RHNP LATFORM	1131	STRING	1	Deprecated
RPMTAG_PLAT FORM	1132	STRING	1	Informational

RPMTAG_BUILDTIME

This tag specifies the time as seconds since the epoch at which the package was built.

RPMTAG_BUILDHOST

This tag specifies the hostname of the system on which the package was built.

RPMTAG_FILEVERIFYFLAGS

This tag specifies the bit(s) to control how files are to be verified after install, specifying which checks should be performed.

RPMTAG_CHANGELOGTIME

This tag specifies the Unix time in seconds since the epoch associated with each entry in the Changelog file.

RPMTAG_CHANGELOGNAME

This tag specifies the name of who made a change to this package.

RPMTAG_CHANGELOGTEXT

This tag specifies the changes associated with a changelog entry.

RPMTAG_OPTFLAGS

This tag indicates additional flags which may have been passed to the compiler when building this package.

RPMTAG_RHNPLATFORM

This tag contains an opaque string whose contents are undefined.

RPMTAG_PLATFORM

This tag contains an opaque string whose contents are undefined.

25.2.5 Payload Section

The Payload section contains a compressed cpio archive. The format of this section is defined by RFC 1952: GZIP File Format Specification.

When uncompressed, the cpio archive contains a sequence of records for each file. Each record contains a CPIO Header, Filename, Padding, and File Data.

Table 25-16 CPIO File Format

CPIO Header	Header structure as defined below.
Filename	NUL terminated ASCII string containing the name of the file.
Padding	0-3 bytes as needed to align the file stream to a 4 byte boundary.
File data	The contents of the file.
Padding	0-3 bytes as needed to align the file stream to a 4 byte boundary.

The CPIO Header uses the following header structure (sometimes referred to as "new ASCII" or "SVR4 cpio"). All numbers are stored as ASCII representations of their hexadecimal value with leading zeros as needed to fill the field. With the exception of *c_namesize* and the corresponding name string, and *c_checksum*, all information contained in the CPIO Header is also represented in the Header Section. The values in the CPIO Header shall match the values contained in the Header Section.

```
struct {
    char c_magic[6];
    char c_ino[8];
    char c_mode[8];
    char c_uid[8];
    char c_gid[8];
    char c_nlink[8];
    char c_mtime[8];
    char c_filesize[8];
    char c_devmajor[8];
    char c_devminor[8];
    char c_rdevmajor[8];
    char c_rdevminor[8];
    char c_namesize[8];
    char c_checksum[8];
};
```

c_magic

Value identifying this cpio format. This value shall be "070701".

c_ino

This field contains the inode number from the filesystem from which the file was read. This field is ignored when installing a package. This field shall match the corresponding value in the `RPMTAG_FILEINODES` index in the Header section.

c_mode

Permission bits of the file. This is an ascii representation of the hexadecimal number representing the bit as defined for the *st_mode* field of the *stat* structure defined for the *stat* function. This field shall match the corresponding value in the `RPMTAG_FILEMODES` index in the Header section.

c_uid

Value identifying this owner of this file. This value matches the uid value of the corresponding user in the `RPMTAG_FILEUSERNAME` as found on the system where this package was built. The username specified in `RPMTAG_FILEUSERNAME` should take precedence when installing the package.

c_gid

Value identifying this group of this file. This value matches the gid value of the corresponding user in the `RPMTAG_FILEGROUPNAME` as found on the system where this package was built. The groupname specified in `RPMTAG_FILEGROUPNAME` should take precedence when installing the package.

c_nlink

Value identifying the number of links associated with this file. If the value is greater than 1, then this filename will be linked to 1 or more files in this archive that has a matching value for the `c_ino`, `c_devmajor` and `c_devminor` fields.

c_mtime

Value identifying the modification time of the file when it was read. This field shall match the corresponding value in the `RPMTAG_FILEMTIMES` index in the Header section.

c_filesize

Value identifying the size of the file. This field shall match the corresponding value in the `RPMTAG_FILESIZES` index in the Header section.

c_devmajor

The major number of the device containing the file system from which the file was read. With the exception of processing files with `c_nlink > 1`, this field is ignored when installing a package. This field shall match the corresponding value in the `RPMTAG_FILEDEVICES` index in the Header section.

c_devminor

The minor number of the device containing the file system from which the file was read. With the exception of processing files with `c_nlink > 1`, this field is ignored when installing a package. This field shall match the corresponding value in the `RPMTAG_FILEDEVICES` index in the Header section.

c_rdevmajor

The major number of the raw device containing the file system from which the file was read. This field is ignored when installing a package. This field shall match the corresponding value in the `RPMTAG_RDEVS` index in the Header section.

c_rdevminor

The minor number of the raw device containing the file system from which the file was read. This field is ignored when installing a package. This field shall match the corresponding value in the `RPMTAG_RDEVS` index in the Header section.

c_namesize

Value identifying the length of the filename, which is located immediately following the CPIO Header structure.

c_checksum

Value containing the CRC checksum of the file data. This field is not used, and shall contain the value "00000000". This field is ignored when installing a package.

A record with the filename "TRAILER!!!" indicates the last record in the archive.

25.3 Package Script Restrictions

Scripts used as part of the package install and uninstall shall only use commands and interfaces that are specified by the LSB. All other commands are not guaranteed to be present, or to behave in expected ways.

Packages shall not use RPM triggers.

Packages shall not depend on the order in which scripts are executed (pre-install, pre-uninstall, etc), when doing an upgrade.

25.4 Package Tools

The LSB does not specify the interface to the tools used to manipulate LSB-conformant packages. Each conforming implementation shall provide documentation for installing LSB packages.

25.5 Package Naming Conventions

Packages supplied by distributions and applications should adhere to the following conventions for the name field within the package. The rules are optional for the filename of the package file itself.

Note: There are discrepancies among implementations concerning whether the name might be `frobicator-1.7-21-ppc32.rpm` or `frobicator-1.7-21-powerpc32.rpm`. The architecture aside, recommended practice is for the filename of the package file to match the name within the package.

The following conventions apply to the name portion of the field alone, not including any release or version portion.

Note: If the package name with the release and version is `frobicator-1.7-21`, the name part is `frobicator` and falls under the conventions for a name with no hyphens.

- If the name begins with `lsb-` and contains no other hyphens, the name should be a package name registered with the Linux Assigned Names and Numbers Authority (<http://www.lanana.org>) (LANANA), which shall maintain a

registry of LSB names. The name may be registered by either an implementation or an application.

- If the name begins with `lsb-` and contains more than one hyphen the portion of the name between the first and second hyphens should be either an LSB provider name registered with the LANANA (for example `lsb-gnome-gnumeric` if `gnome` is registered), or a domain name registered to the provider in the DNS system. (for example `lsb-distro.example.com-database`). The LSB provider name registered with the LANANA shall only consist of the ASCII characters `[a-z0-9]`. The domain name, in accordance with DNS rules, shall be lower case only. The provider name or domain name may be either that of a distribution or an application.
- Package names containing no hyphens are reserved for use by distributions. Applications shall not use such names.
- Package names which do not start with `lsb-` and which contain a hyphen are open to both distributions and applications. Distributions may name packages in any part of this namespace. They are encouraged to use names from one of the other namespaces available to them, but this is not mandatory due to the large amount of current practice to the contrary.

Note: Widespread existing practice includes such names as `ssh-common`, `ssh-client`, `kernel-pcmcia`, and the like. Possible alternative names include `sshcommon`, `foolinux-ssh-common` (where `foolinux` is registered to the distribution), or `lsb-foolinux-ssh-common`.

Applications may name their packages this way, but only if the portion of the name before the first hyphen is a provider name or registered domain name as described above.

Note: If an application vendor has domain name such as `visicalc.example.com` and has registered `visicalc` as a provider name, they could name packages either in the `visicalc-base` style or the `visicalc.example.com-charting` style.

Package names in this namespace are available to both the distribution and an application. Distributions and applications need to consider the potential for conflicts when deciding to use these names rather than the alternatives (such as names starting with `lsb-`).

25.6 Package Dependencies

Packages shall have a dependency that indicates which LSB modules are required. LSB module descriptions are dash separated tuples containing the name 'lsb', the module name, and the architecture name. The following dependencies may be used.

`lsb-core`

This dependency is used to indicate that the application is dependent on features contained in the LSB Core specification.

`lsb-core-arch`

This dependency is used to indicate that the application is dependent on features contained in the LSB Core specification and that the package contains architecture specific features. This architecture specific dependency

is described in the relevant architecture specific part of the LSB Core specification.

lsb-core-noarch

This dependency is used to indicate that the application is dependent on features contained in the LSB Core specification and that the package does not contain any architecture specific files.

These dependencies shall have a version of 5.0.

Packages shall not depend on other system-provided dependencies. They shall not depend on non-system-provided dependencies unless the package provider also makes available the LSB conforming packages needed to satisfy such dependencies.

Other modules in the LSB may supplement this list. The architecture specific dependencies are described in the relevant architecture specific LSB.

25.7 Package Architecture Considerations

Packages which do not contain any architecture specific files should specify an architecture of `noarch`. An LSB runtime environment shall accept values `noarch`, or the value specified in the relevant architecture specific part of the LSB Core Specification.

Additional specifications or restrictions may be found in the architecture specific LSB specification.

Annex A Alphabetical Listing of Interfaces by Library

A.1 libc

The behavior of the interfaces in this library is specified by the following Standards.

Large File Support [LFS]

This Specification [LSB]

RFC 5531/4506 RPC & XDR [RPC + XDR]

SUSv2 [SUSv2]

POSIX 1003.1-2001 (ISO/IEC 9945-2003) [SUSv3]

POSIX 1003.1-2008 (ISO/IEC 9945-2009) [SUSv4]

SVID Issue 4 [SVID.4]

Table A-1 libc Function Interfaces

_Exit[SUSv4]	getdelim[SUSv4]	scandir[SUSv4]
_IO_feof[LSB]	getdomainname[LSB]	scandir64[LSB]
_IO_getc[LSB]	getdtablesize[LSB]	scanf[LSB]
_IO_putc[LSB]	getegid[SUSv4]	sched_get_priority_max[SUSv4]
_IO_puts[LSB]	getenv[SUSv4]	sched_get_priority_min[SUSv4]
